

ZC706 Evaluation Board for the Zynq-7000 XC7Z045 SoC

User Guide

UG954 (v1.8) August 6, 2019

Notice of Disclaimer

The information disclosed to you hereunder (the "Materials") is provided solely for the selection and use of Xilinx products. To the maximum extent permitted by applicable law: (1) Materials are made available "AS IS" and with all faults, Xilinx hereby DISCLAIMS ALL WARRANTIES AND CONDITIONS, EXPRESS, IMPLIED, OR STATUTORY, INCLUDING BUT NOT LIMITED TO WARRANTIES OF MERCHANTABILITY, NON-INFRINGEMENT, OR FITNESS FOR ANY PARTICULAR PURPOSE; and (2) Xilinx shall not be liable (whether in contract or tort, including negligence, or under any other theory of liability) for any loss or damage of any kind or nature related to, arising under, or in connection with, the Materials (including your use of the Materials), including for any direct, indirect, special, incidental, or consequential loss or damage (including loss of data, profits, goodwill, or any type of loss or damage suffered as a result of any action brought by a third party) even if such damage or loss was reasonably foreseeable or Xilinx had been advised of the possibility of the same. Xilinx assumes no obligation to correct any errors contained in the Materials or to notify you of updates to the Materials or to product specifications. You may not reproduce, modify, distribute, or publicly display the Materials without prior written consent. Certain products are subject to the terms and conditions of Xilinx's limited warranty, please refer to Xilinx's Terms of Sale which can be viewed at www.xilinx.com/legal.htm#tos; IP cores may be subject to warranty and support terms contained in a license issued to you by Xilinx. Xilinx products are not designed or intended to be fail-safe or for use in any application requiring fail-safe performance; you assume sole risk and liability for use of Xilinx products in such critical applications, please refer to Xilinx's Terms of Sale which can be viewed at www.xilinx.com/legal.htm#tos.

AUTOMOTIVE APPLICATIONS DISCLAIMER

AUTOMOTIVE PRODUCTS (IDENTIFIED AS "XA" IN THE PART NUMBER) ARE NOT WARRANTED FOR USE IN THE DEPLOYMENT OF AIRBAGS OR FOR USE IN APPLICATIONS THAT AFFECT CONTROL OF A VEHICLE ("SAFETY APPLICATION") UNLESS THERE IS A SAFETY CONCEPT OR REDUNDANCY FEATURE CONSISTENT WITH THE ISO 26262 AUTOMOTIVE SAFETY STANDARD ("SAFETY DESIGN"). CUSTOMER SHALL, PRIOR TO USING OR DISTRIBUTING ANY SYSTEMS THAT INCORPORATE PRODUCTS, THOROUGHLY TEST SUCH SYSTEMS FOR SAFETY PURPOSES. USE OF PRODUCTS IN A SAFETY APPLICATION WITHOUT A SAFETY DESIGN IS FULLY AT THE RISK OF CUSTOMER, SUBJECT ONLY TO APPLICABLE LAWS AND REGULATIONS GOVERNING LIMITATIONS ON PRODUCT LIABILITY.

Revision History

The following table shows the revision history for this document.

Date	Version	Revision
10/08/2012	1.0	Initial Xilinx release.
11/21/2012	1.1	Added additional user LED in ZC706 Evaluation Board Features section, Table 1-1 , User I/O section, Figure 1-26 , and Table 1-28 . In Table 1-1 , added fan sink information and updated notes for 10/100/1000 Ethernet PHY, user pushbuttons, user DIP switch, and FPGA PROG pushbutton. Added Encryption Key Backup Circuit section. Updated second paragraph in DDR3 SODIMM Memory (PL) section. Updated second paragraph in SD Card Interface section. Updated Table 1-11 . Added U53 information to first paragraph in HDMI Video Output section. Added fourth bullet to Real Time Clock (RTC) section. Updated Figure 1-24 . Added pin A17 to Table 1-28 . Updated Figure 1-33 . Replaced UCF in Appendix C . Added additional reference to Additional Resources .

Date	Version	Revision
04/24/2013	1.2	<p>Chapter 1, ZC706 Evaluation Board Features: Table 1-1 feature descriptions are now linked to their respective sections in the book. Figure 1-3, Figure 1-34, and Figure 1-35 were replaced. Table 1-2 was removed because it was a duplicate of Table 1-11. Table 1-2: Switch SW11 Configuration Option Settings was added. FMC Connector JTAG Bypass, page 35 was updated. Default lane size information below Figure 1-18 was changed. Figure 1-19 PCI Express Lane Size Select Jumper J19 was added. The names of pins 18 and 19 changed in Table 1-17. The address of I²C bus PMBUS_DATA/CLOCK changed in Table 1-25. Reference designator DS35 was added to Table 1-27. Callout numbers in the User I/O, page 59 section are now linked to Table 1-1. SW13 information was added to the section User Pushbuttons, page 61. In Table 1-33, J5 pin H22 changed to XC7Z045 (U1) pin AH26 and H23 changed to AH27. The section ZC706 Board Power System, page 74 was added. Voltage levels were changed in VADJ Voltage Control, page 81. Table 1-37 was modified and Table 1-38 was added.</p> <p>Appendix A, Default Switch and Jumper Settings: The SW11 selection in Table A-1 changed.</p> <p>Appendix F, Regulatory and Compliance Information: A link to the master answer record was added.</p>
07/31/2013	1.3	Updated Table 1-22 . Replaced the master User Constraints File (UCF) list in Appendix C, Xilinx Constraints File with the master Xilinx Design Constraints (XDC) list. Updated references throughout the document.
04/28/2015	1.4	Updated "LMZ22000 Family Regulator Description" to LMZ31500 and LMZ31700 Family Regulator Description . Updated Table 1-4 , Table 1-7 , Table 1-13 , Table 1-23 , Table 1-28 through Table 1-30 , Table 1-32 through Table 1-34 , Table 1-36 , and Table A-2 . Added Figure A-1 . Updated Appendix C, Xilinx Constraints File .
09/10/2015	1.5	Updated J48 header jumper setting (third row in Table 1-7).
03/29/2016	1.6	Updated value of C6 in Figure 1-33 from 270 pF to 5600 pF.
07/01/2018	1.7	Editorial updates only. No technical content updates.
08/06/2019	1.8	Updated Figure 1-27 from VADJ to VCC1V5_PL. Appendix F, Regulatory and Compliance Information : An updated link to the master answer record was added.

ZC706 Evaluation Board Features

Overview

The ZC706 evaluation board for the XC7Z045 SoC provides a hardware environment for developing and evaluating designs targeting the Zynq®-7000 XC7Z045-2FFG900C SoC. The ZC706 evaluation board provides features common to many embedded processing systems, including DDR3 SODIMM and component memory, a four-lane PCI Express® interface, an Ethernet PHY, general purpose I/O, and two UART interfaces. Other features can be supported using VITA-57 FPGA mezzanine cards (FMC) attached to the low pin count (LPC) FMC and high pin count (HPC) FMC connectors.

ZC706 Evaluation Board Features

The ZC706 evaluation board features are listed in here. Detailed information for each feature is provided in [Feature Descriptions](#) starting on [page 15](#).

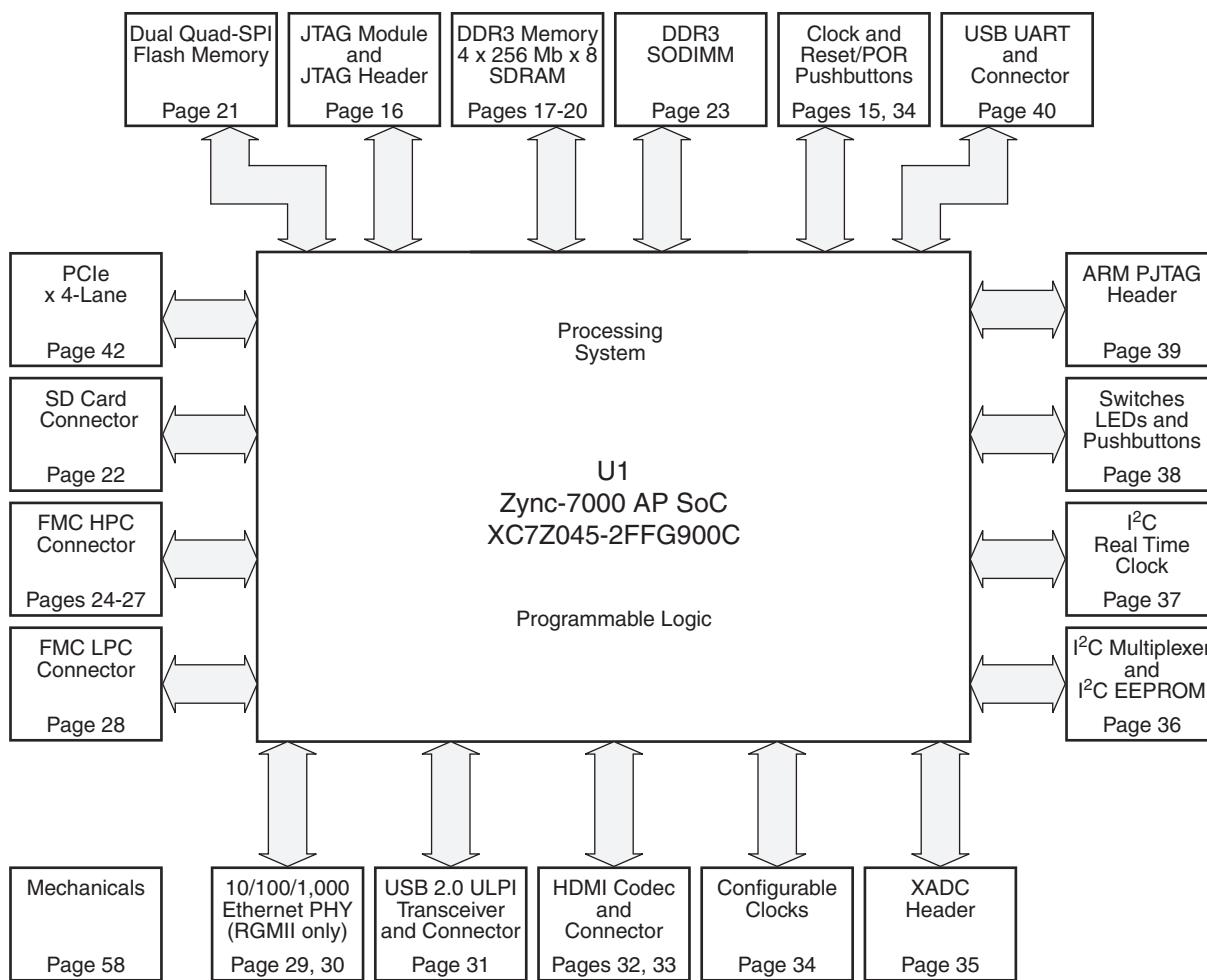

- Zynq-7000 XC7Z045-2FFG900C SoC
- 1 GB DDR3 memory SODIMM on the programmable logic (PL) side
- 1 GB DDR3 component memory (four [256 Mb x 8] devices) on the processing system (PS) side
- Two 128 Mb Quad-SPI (QSPI) flash memory (Dual Quad-SPI)
- USB 2.0 ULPI (UTMI+ low pin interface) transceiver with micro-B USB connector
- Secure Digital (SD) connector
- USB JTAG interface via Digilent module with micro-B USB connector
- Clock sources:
 - Fixed 200 MHz LVDS oscillator (differential)
 - I²C programmable LVDS oscillator (differential)
 - Fixed 33.33 MHz LVCMOS oscillator (single-ended)
 - Subminiature version A (SMA) connectors (differential)
 - SMA connectors for GTX transceiver clocking (differential)

- GTX transceivers
 - FMC HPC connector (eight GTX transceivers)
 - FMC LPC connector (one GTX transceiver)
 - SMA connectors (one pair each for TX, RX and REFCLK)
 - PCI Express (four lanes)
 - Small form-factor pluggable plus (SFP+) connector
 - Ethernet PHY RGMII interface
- PCI Express endpoint connectivity
 - Gen1 4-lane (x4)
 - Gen2 4-lane (x4)
- SFP+ Connector
- Ethernet PHY RGMII interface with RJ-45 connector
- USB-to-UART bridge with mini-B USB connector
- HDMI codec with HDMI connector
- I²C bus
- I²C bus multiplexed to:
 - Si570 user clock
 - ADV7511 HDMI codec
 - M24C08 EEPROM (1 kB)
 - 1-to-16 TCA6416APWR port expander
 - DDR3 SODIMM
 - RTC-8564JE real time clock
 - FMC HPC connector
 - FMC LPC connector
 - PMBUS data/clock
- Status LEDs:
 - Ethernet status
 - TI Power Good
 - Linear Power Good
 - PS DDR3 Component V_{tt} Good
 - PL DDR3 SODIMM V_{tt} Good

- FMC Power Good
- 12V Input Power On
- FPGA INIT
- FPGA DONE
- User I/O:
 - Four (PL) user LEDs
 - Three (PL) user pushbuttons
 - One (PL) user DIP switch (4-pole)
 - Two Dual row Pmod GPIO headers
- SoC PS Reset Pushbuttons:
 - SRST_B PS reset button
 - POR_B PS reset button
- VITA 57.1 FMC HPC connector
- VITA 57.1 FMC LPC connector
- Power on/off slide switch
- Program_B pushbutton
- Power management with PMBus voltage and current monitoring through TI power controller
- Dual 12-bit 1 MSPS XADC analog-to-digital front end
- Configuration options:
 - Dual Quad-SPI flash memory
 - USB JTAG configuration port (Digilent module)
 - Platform cable header JTAG configuration port
 - 20-pin PL PJTAG header

Block Diagram

The ZC706 evaluation board block diagram is shown in [Figure 1-1](#).

Note: Page numbers reference the page number of schematic 0381513.

UG954_c1_01_1002012

Figure 1-1: ZC706 Evaluation Board Block Diagram

Board Layout

[Figure 1-3](#) shows the ZC706 evaluation board. Each numbered feature that is referenced in [Figure 1-3](#) is described in [Table 1-1](#) with a link to detailed information provided under [Feature Descriptions](#) starting on [page 15](#).

Note: The image in [Figure 1-3](#) is for reference only and might not reflect the current revision of the board.

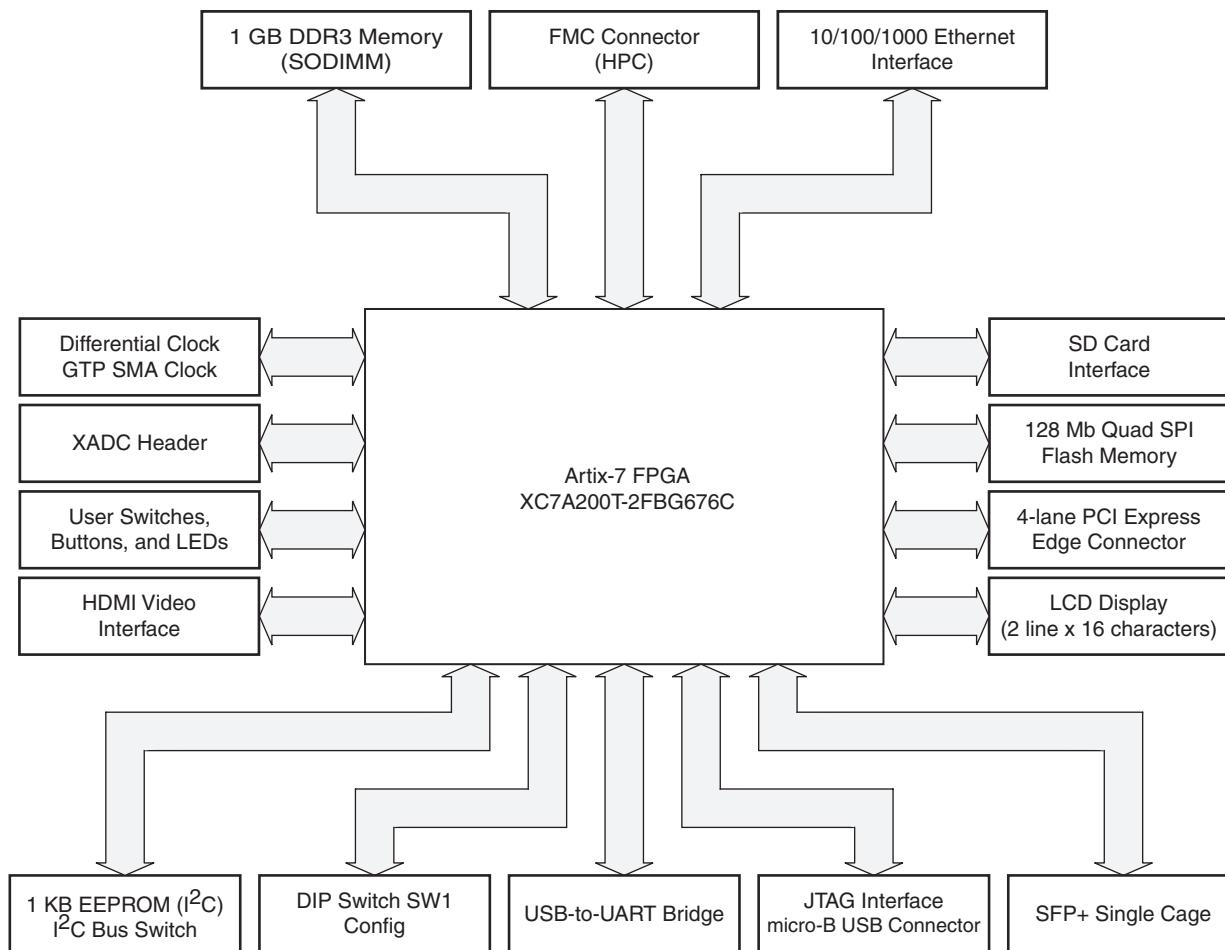

Discharge Caution

CAUTION! *ESD can damage electronic components when they are improperly handled, and can result in total or intermittent failures. Always follow ESD-prevention procedures when removing and replacing components.*

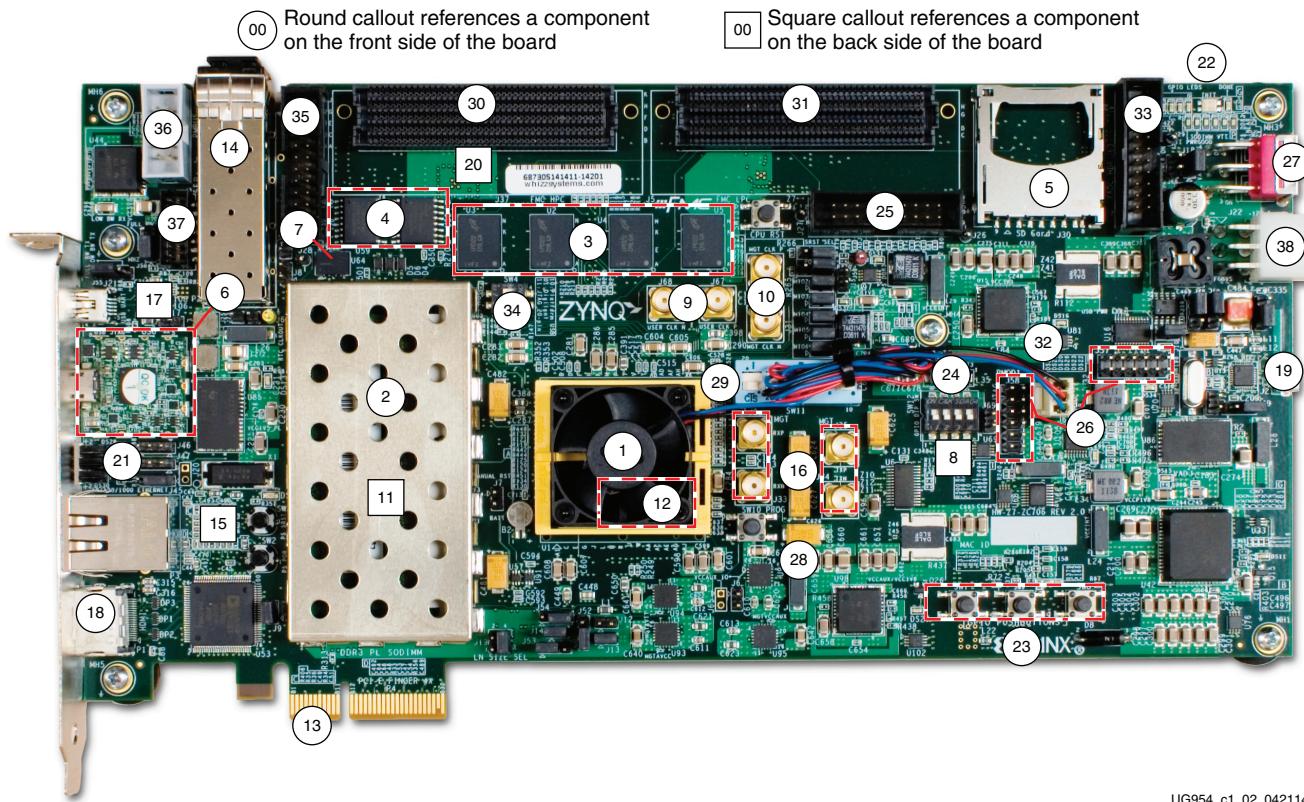

To prevent ESD damage:

- Use an ESD wrist or ankle strap and ensure that it makes skin contact. Connect the equipment end of the strap to an unpainted metal surface on the chassis.
- Avoid touching the adapter against your clothing. The wrist strap protects components from ESD on the body only.
- Handle the adapter by its bracket or edges only. Avoid touching the printed circuit board or the connectors.
- Put the adapter down only on an antistatic surface such as the bag supplied in your kit.
- If you are returning the adapter to Xilinx Product Support, place it back in its antistatic bag immediately.
- If a wrist strap is not available, ground yourself by touching the metal chassis before handling the adapter or any other part of the computer/server.

Notes:

1. Jumper header locations are identified in [Appendix A, Default Switch and Jumper Settings](#).

Feature Descriptions

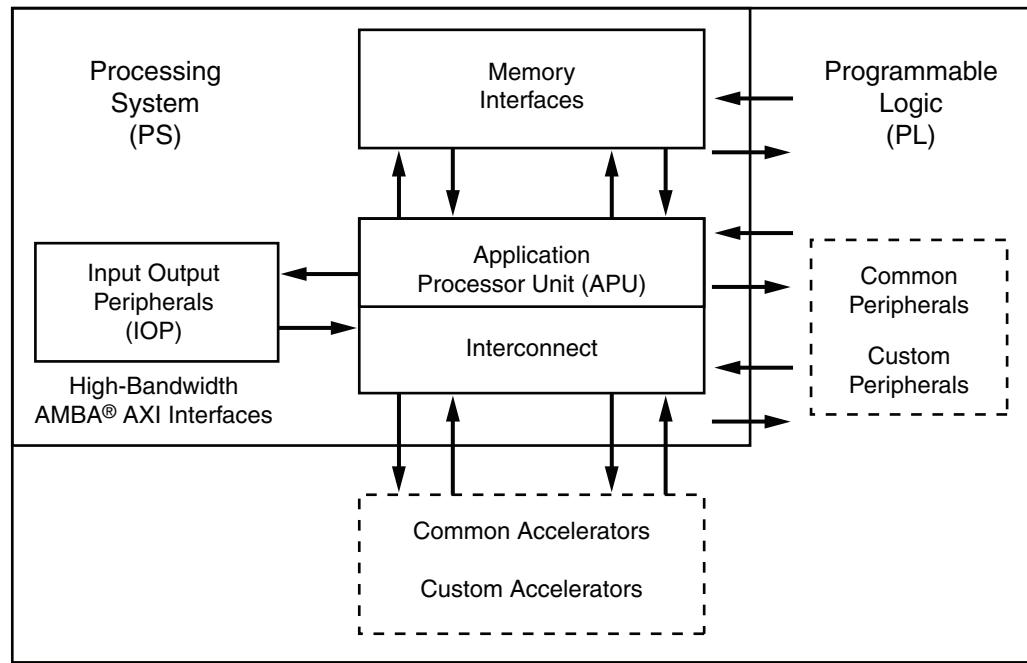

Detailed information for each feature shown in [Figure 1-3](#) and listed in [Table 1-1](#) is provided in this section.

Zynq-7000 XC7Z045 SoC

[[Figure 1-3](#), callout 1]

The ZC706 evaluation board is populated with the Zynq-7000 XC7Z045-2FFG900C SoC.

The XC7Z045 SoC consists of an integrated processing system (PS) and programmable logic (PL), on a single die. The high-level block diagram is shown in [Figure 1-4](#).

UG954_c1_03_100112

Figure 1-4: High-Level Block Diagram

The PS integrates two ARM® Cortex™-A9 MPCore™ application processors, AMBA® interconnect, internal memories, external memory interfaces, and peripherals including USB, Ethernet, SPI, SD/SDIO, I²C, CAN, UART, and GPIO. The PS runs independently of the PL and boots at power-up or reset.

A system level block diagram is shown in [Figure 1-5](#).

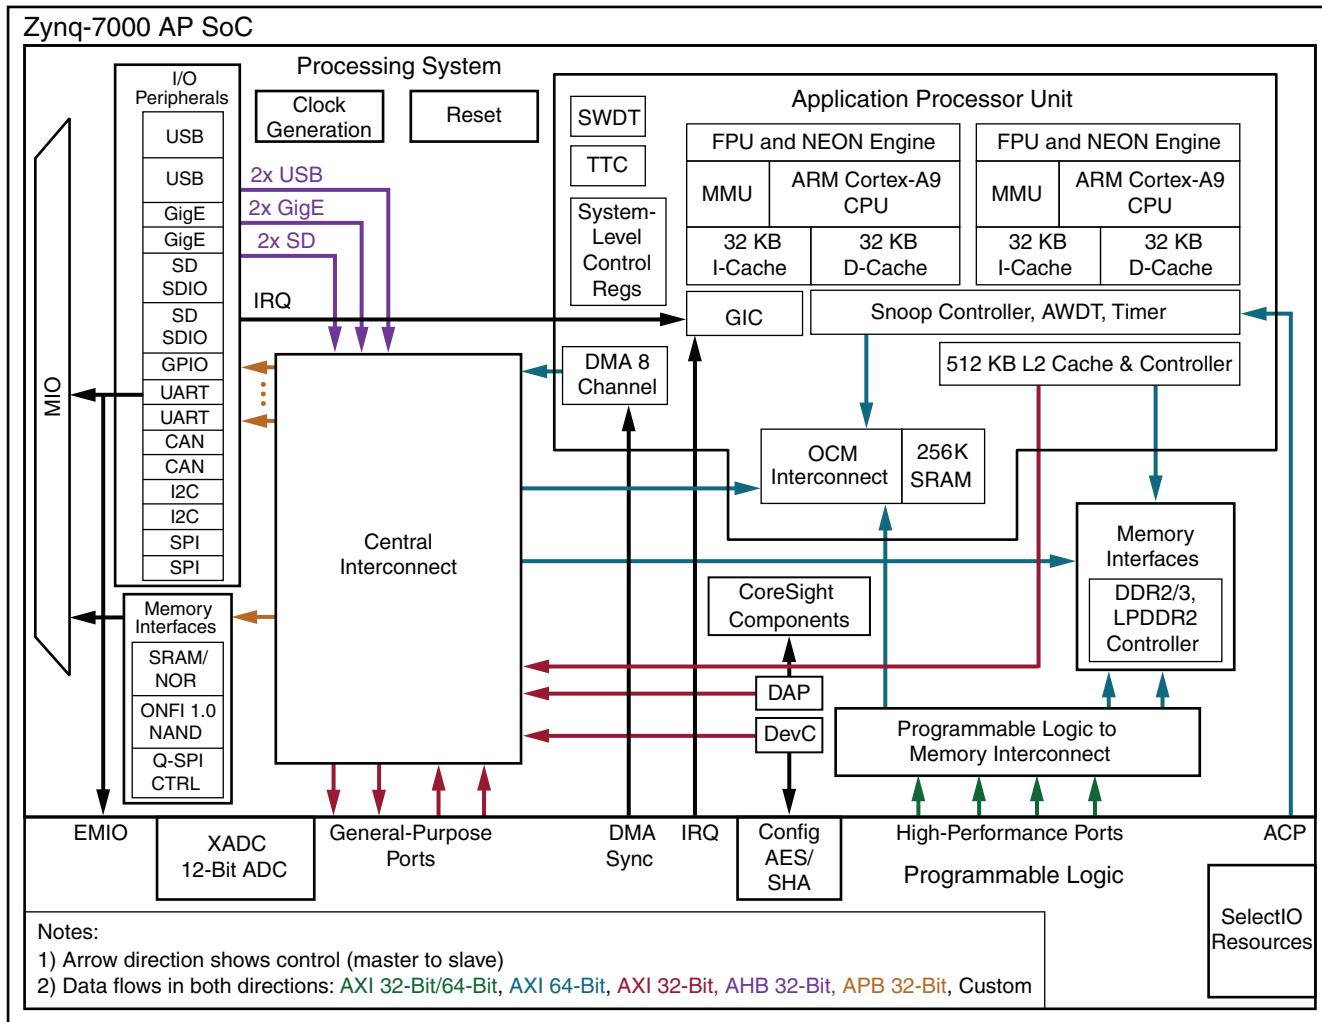

Figure 1-5: Zynq-7000 Block Diagram

For additional information on Zynq-7000 SoC devices, see [Zynq-7000 SoC Overview \(DS190\)](#) and [Zynq-7000 SoC Technical Reference Manual \(UG585\)](#).

Device Configuration

the Zynq-7000 XC7Z045 SoC uses a multi-stage boot process that supports both a non-secure and a secure boot. The PS is the master of the boot and configuration process. For a secure boot, the PL must be powered on to enable the use of the security block located within the PL, which provides 256-bit AES and SHA decryption/authentication.

The ZC706 evaluation board supports these configuration options:

- PS Configuration: Quad-SPI flash memory
- PS Configuration: Processor System Boot from SD Card (J30)

- PL Configuration: USB JTAG configuration port (Digilent module U30)
- PL Configuration: Platform cable header J3 and flying lead header J62 JTAG configuration ports

TIP: Designs using serial configuration based on Quad-SPI flash memory can take advantage of low-cost commodity SPI flash memory.

The JTAG configuration option is selected by setting SW11 (PS) as shown in [Table 1-2](#) and SW4 (PL) as described in [Programmable Logic JTAG Programming Options, page 33](#). SW11 is callout [29](#) in [Figure 1-3](#).

Table 1-2: Switch SW11 Configuration Option Settings

Boot Mode	SW11.1	SW11.2	SW11.3	SW11.4	SW11.5
JTAG mode ⁽¹⁾	0	0	0	0	0
Independent JTAG mode	1	0	0	0	0
QSPI mode	0	0	0	1	0
SD mode	0	0	1	1	0
MIO configuration pin	MIO2	MIO3	MIO4	MIO5	MIO6

Notes:

1. Default switch setting

For more information about Zynq-7000 SoC configuration settings, see [Zynq-7000 SoC Technical Reference Manual \(UG585\)](#).

Encryption Key Backup Circuit

The XC7Z045 SoC U1 implements bitstream encryption key technology. The ZC706 board provides the encryption key backup battery circuit shown in [Figure 1-6](#). The Seiko TS518FE rechargeable 1.5V lithium button-type battery B2 is soldered to the board with the positive output connected to the XC7Z045 SoC U1 VCCBATT pin P9. The battery supply current IBATT specification is 150 nA max when board power is off. B2 is charged from the VCCAUX 1.8V rail through a series diode with a typical forward voltage drop of 0.38V and 4.7 KΩ current limit resistor. The nominal charging voltage is 1.42V.

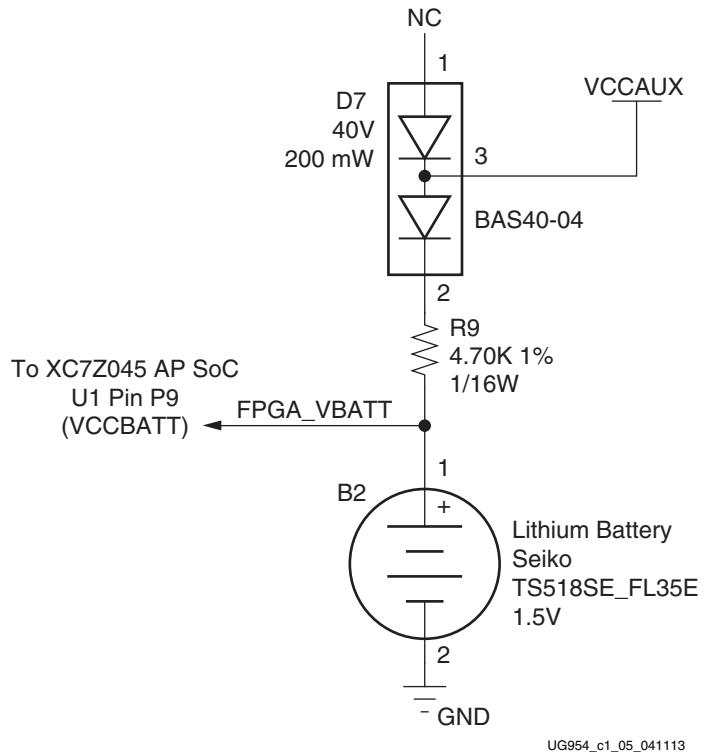

Figure 1-6: Encryption Key Backup Circuit

I/O Voltage Rails

There are eleven I/O banks available on the XC7Z045 SoC. The voltages applied to the XC7Z045 SoC I/O banks used by the ZC706 evaluation board are listed in [Table 1-3](#).

Table 1-3: I/O Voltage Rails

XC7Z045 (U1) Bank	Net Name	Voltage	Connected To
PL Bank 0	VCC3V3_FPGA	3.3V	SoC Configuration Bank 0
PL Bank 9	VADJ_FPGA	2.5V	PMOD, USER_SMA_CLOCK, SM_FAN, REC_CLOCK, SFP_TX_DISABLE
PL Bank 10			FMC_LPC, PL_JTAG, GPIO
PL Bank 11			FMC_HPC, GPIO_LED, HDMI
PL Bank 12			FMC_LPC, HDMI
PL Bank 13			FMC_HPC, HDMI
PL Bank 33	VCC1V5_PL	1.5V	PL_DDR3_D[31:0]
PL Bank 34			PL_DDR3_A, SYSCLK
PL Bank 35			PL_DDR3_D[63:32], XADC

Table 1-3: I/O Voltage Rails (Cont'd)

XC7Z045 (U1) Bank	Net Name	Voltage	Connected To
PS Bank 500	VCCP1V8	1.8V	QSPI0,QSPI1
PS Bank 501			PHY_IF,SDIO_IF,USB_IF
PS Bank 502			PS_DDR3_IF

Notes:

1. The ZC706 evaluation board is shipped with V_{ADJ} set to 2.5V.

DDR3 SODIMM Memory (PL)

[Figure 1-3, callout 2]

The memory module at J1 is a 1 GB DDR3 small outline dual-inline memory module (SODIMM). It provides volatile synchronous dynamic random access memory (SDRAM) for storing user code and data.

- Part number: MT8JTF12864HZ-1G6G1 (Micron Technology)
- Supply voltage: 1.5V
- Datapath width: 64 bits
- Data rate: Up to 1,600 MT/s

The ZC706 XC7Z045 SoC PL DDR interface performance is documented in the Zynq-7000 SoC (Z-7030, 035, 045, and Z-7100): DC and AC Switching Characteristics Data Sheet (DS191)[Ref 2].

The DDR3 interface is implemented across the PL-side I/O banks. Bank 33 and bank 35 have a dedicated DCI VRP/N resistor connection. An external 0.75V reference VTTREF_SODIMM is provided for data interface banks. Any interface connected to these banks that requires the VTTREF voltage must use this FPGA voltage reference. The connections between the DDR3 memory and the SoC are listed in Table 1-4.

Table 1-4: DDR3 SODIMM Socket J1 Connections to the XC7Z045 SoC

XC7Z045 (U1) Pin	Net Name	I/O Standard	DDR3 SODIMM Memory J1	
			Pin Number	Pin Name
E10	PL_DDR3_A0	SSTL15	98	A0
B9	PL_DDR3_A1	SSTL15	97	A1
E11	PL_DDR3_A2	SSTL15	96	A2
A9	PL_DDR3_A3	SSTL15	95	A3
D11	PL_DDR3_A4	SSTL15	92	A4
B6	PL_DDR3_A5	SSTL15	91	A5
F9	PL_DDR3_A6	SSTL15	90	A6

Table 1-4: DDR3 SODIMM Socket J1 Connections to the XC7Z045 SoC (Cont'd)

XC7Z045 (U1) Pin	Net Name	I/O Standard	DDR3 SODIMM Memory J1	
			Pin Number	Pin Name

The ZC706 DDR3 SODIMM interface adheres to the constraints guidelines documented in the "Dynamic Memory" section of the *Zynq-7000 SoC PCB Design and Pin Planning Guide* ([UG933](#)). The ZC706 DDR3 SODIMM interface is a 40Ω impedance implementation. For more details, see the MT8JTF12864HZ-1G6G1 data sheet [\[Ref 35\]](#).

DDR3 Component Memory (PS)

[Figure 1-3, callout 3]

The 1 GB, 32-bit wide DDR3 component memory system is comprised of four SDRAMs at U2-U5. This memory system is connected to the XC7Z045 SoC Processing System (PS) memory interface bank 502.

- Part number: MT41J256M8HX-15E (Micron Technology)
- Configuration: 2Gb: 256 Mb x 8
- Supply voltage: 1.5V
- Datapath width: 32 bits
- Data rate: Up to 1,333 MT/s

The ZC706 XC7Z045 SoC PS DDR Bank 502 interface performance is documented in the Zynq-7000 SoC (Z-7030, 035, 045, and Z-7100): DC and AC Switching Characteristics Data Sheet (DS191) [\[Ref 2\]](#).

The DDR3 0.75V VTT termination voltage is sourced from linear regulator U27. The connections between the DDR3 component memory and XC7Z045 SoC bank 502 are listed in [Table 1-5](#).

The ZC706 DDR3 component interface adheres to the constraints guidelines documented in the *DDR3 Design Guidelines* section of *Zynq-7000 SoC PCB Design and Pin Planning Guide* ([UG933](#)). The ZC706 DDR3 component interface is a 40Ω impedance implementation. For more details, see the MT41J256M8HX-15E data sheet [[Ref 35](#)].

Quad-SPI Flash Memory

[Figure 1-3, callout 4]

The Quad-SPI flash memory located at U58 and U59 provides 2×128 Mb of nonvolatile storage that can be used for configuration and data storage.

- Part number: S25FL128SAGMFIR01 (Spansion)
- Supply voltage: 1.8V
- Datapath width: 4 bits
- Data rate: Various depending on Single/Dual/Quad mode

The connections between the SPI flash memory and the XC7Z045 SoC are listed in [Table 1-6](#).

Table 1-6: Quad-SPI Flash Memory Connections to the XC7Z045 SoC

The configuration section of the *Zynq-7000 SoC Technical Reference Manual* [UG585](#), provides details on using the Quad-SPI flash memory.

[Figure 1-7](#) shows the connections of the linear Quad-SPI flash memory on the ZC706 evaluation board. For more details, see the Spansion S25FL128SAGMFIR01 data sheet [\[Ref 17\]](#).

UG954_c1_06_073013

Figure 1-7: 128 Mb Quad-SPI Flash Memory

USB 2.0 ULPI Transceiver

[Figure 1-3, callout 19]

The ZC706 evaluation board uses a Standard Microsystems Corporation USB3320 USB 2.0 ULPI Transceiver at U12 to support a USB connection to the host computer. A USB cable is supplied in the ZC706 evaluation kit (Standard-A connector to host computer, Micro-B connector to ZC706 evaluation board connector J2). The USB3320 is a high-speed USB 2.0 PHY supporting the UTMI+ low pin interface (ULPI) interface standard. The ULPI standard defines the interface between the USB controller IP and the PHY device which drives the physical USB bus. Use of the ULPI standard reduces the interface pin count between the USB controller IP and the PHY device.

The USB3320 is clocked by a 24 MHz crystal. Consult the SMSC USB3320 data sheet for clocking mode details [Ref 18].

The interface to the USB3320 transceiver is implemented through the IP in the XC7Z045 SoC Processor System.

Table 1-7 describes the jumper settings for the USB 2.0 circuit. Bold text identifies the default OTG mode settings.

Table 1-7: USB Jumper Settings

Header	Function	Shunt Position	Notes
J11	USB PHY reset	Shunt ON = USB PHY reset Shunt OFF = USB PHY normal operation	Clean reset requires external debouncing
J10	V _{BUS} 5V Supply	Shunt ON = Host or OTG mode Shunt OFF = Device mode	
J48	RVBUS select	Position 1-2 = Device mode only (10 KΩ) Position 2-3 = OTG or Host mode (1 KΩ)	Oversupply protection
J50	CVBUS select	Position 1-2 = OTG and Device mode 1 μF Position 2-3 = Host mode 120 μF	V _{BUS} load capacitance
J49	Cable ID select	Position 1-2 = A/B cable detect Position 2-3 = ID not used	Used in OTG mode
J51	USB Micro-B	Position 1-2 = Shield connected to GND Position 2-3 = Shield floating	

The connections between the USB Micro-B connector at J2 and the PHY at U12 are listed in [Table 1-8](#).

Table 1-8: USB Connector Pin Assignments and Signal Definitions Between J2 and U12

USB Connector J1		Net Name	Description	USB3320 (U12) Pin
Pin	Name			
1	VBUS	USB_VBUS_SEL	+5V from host system	22
2	D_N	USB_D_N	Bidirectional differential serial data (N-side)	19
3	D_P	USB_D_P	Bidirectional differential serial data (P-side)	18
5	GND	GND	Signal ground	33

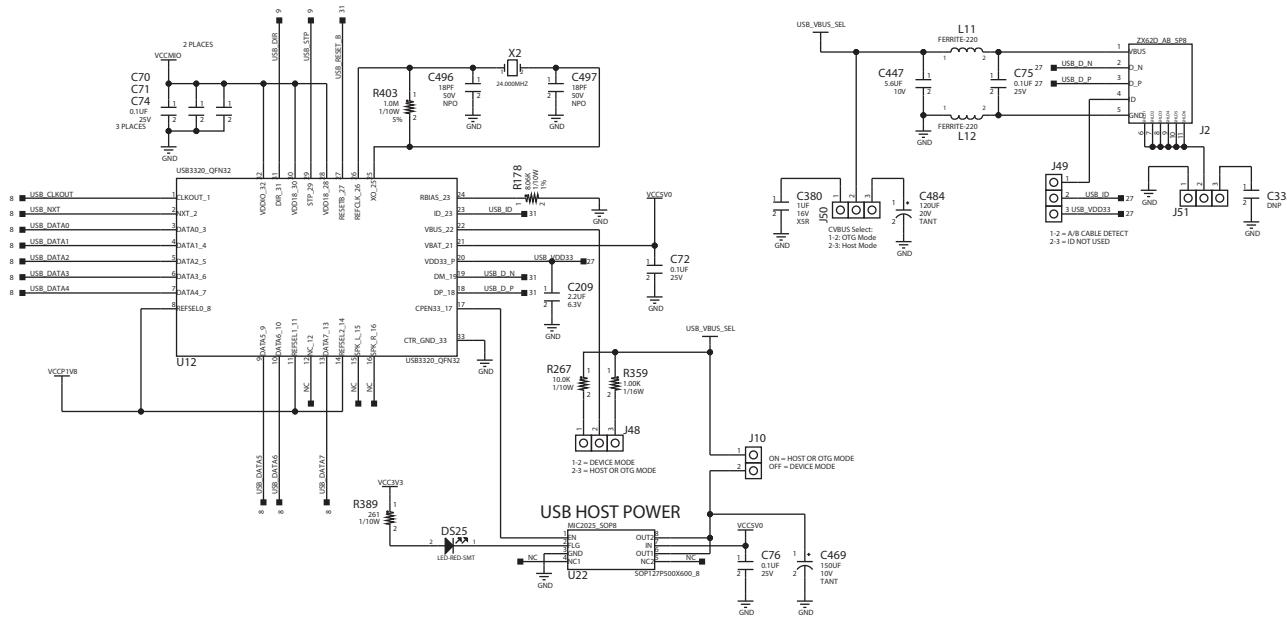

The connections between the USB 2.0 PHY at U12 and the XC7Z045 SoC are listed in [Table 1-9](#).

Table 1-9: USB 2.0 ULPI Transceiver Connections to the XC7Z045 SoC

For additional information on the Zynq-7000 SoC device USB controllers, see [Zynq-7000 SoC Overview \(DS190\)](#) and [Zynq-7000 SoC Technical Reference Manual \(UG585\)](#).

Figure 1-8 shows the USB 2.0 ULPI transceiver circuitry. Note that the shield for the USB Micro-B connector (J2) can be tied to GND by a jumper on header J51 pins 1–2 (default). The USB shield can optionally be connected through a capacitor to GND by installing a capacitor (body size 0402) at location C335 and jumping pins 2–3 on header J51.

UG954_c1_07_041113

Figure 1-8: USB 2.0 ULPI Transceiver

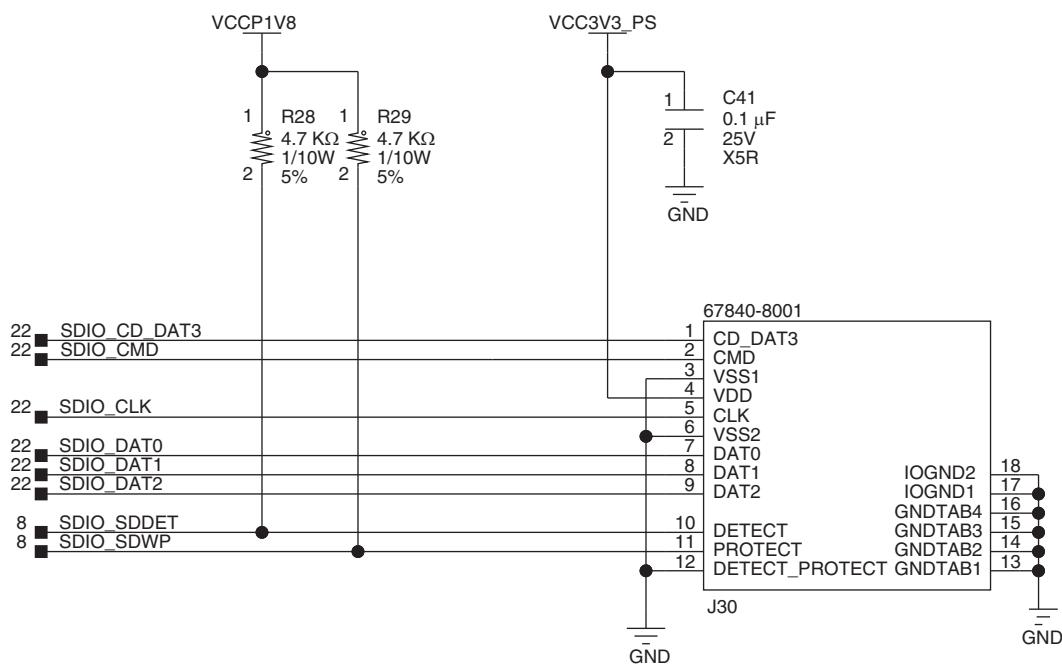

SD Card Interface

[Figure 1-3, callout 5]

The ZC706 evaluation board includes a secure digital input/output (SDIO) interface to provide user-logic access to general purpose nonvolatile SDIO memory cards and peripherals. Information for the SD I/O card specification can be found at the SanDisk and SD card websites [Ref 19], [Ref 20].

The SDIO signals are connected to XC7Z045 SoC PS bank 501 which has its VCCMIO set to 1.8V. A MAX13035E high-speed logic-level translator (U11) is used between XC7Z045 SoC 1.8V PS bank 501 and the 3.3V SD card connector (J30).

Figure 1-9 shows the connections of the SD card interface on the ZC706 evaluation board.

UG954_c1_08_041113

Figure 1-9: SD Card Interface

Table 1-10 lists the SD card interface connections to the XC7Z045 SoC

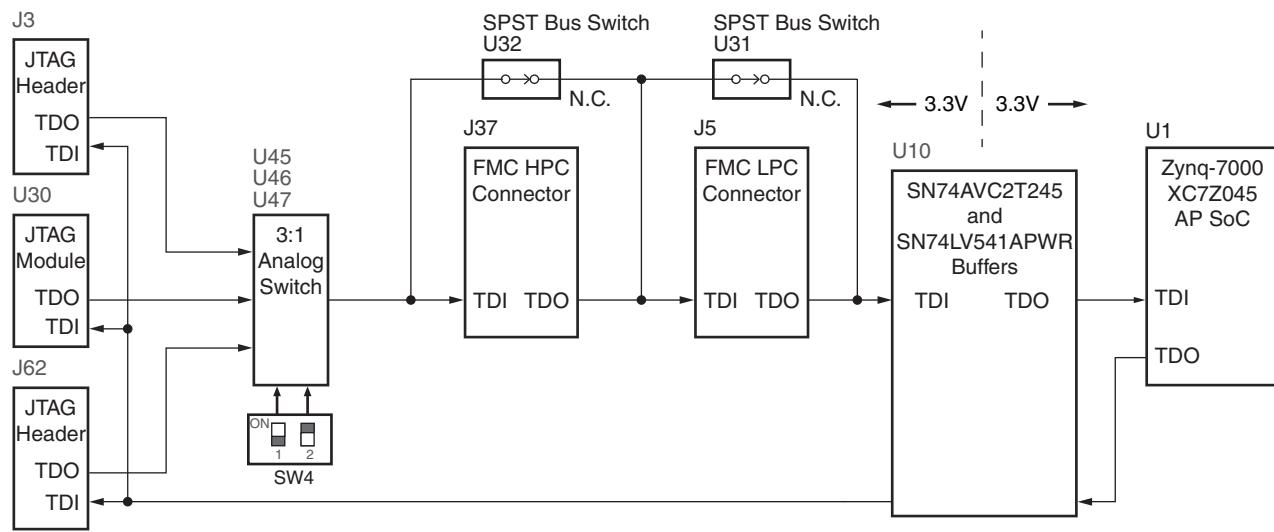

Table 1-10: SDIO Connections to the XC7Z045 SoC

XC7Z045 (U1) Pin			Schematic Net Name	Level Shifter (U11)		SDIO Connector (J30)	
Pin Name	Bank	Pin Number		1.8V Side Pin	3.3V Side Pin	Pin Number	Pin Name

Programmable Logic JTAG Programming Options

[Figure 1-3, callout 6]

The ZC706 evaluation board JTAG chain is shown in [Figure 1-10](#).

UG954_c1_09_041113

Figure 1-10: JTAG Chain Block Diagram

Programmable Logic JTAG Select Switch

[Figure 1-3, callout 35]

The PL JTAG chain can be programmed by three different methods made available through a 3-to-1 analog switch (U45, U46, and U47) controlled by a 2-position DIP switch at SW4.

[Figure 1-11](#) shows the JTAG analog switches and DIP switch SW4.

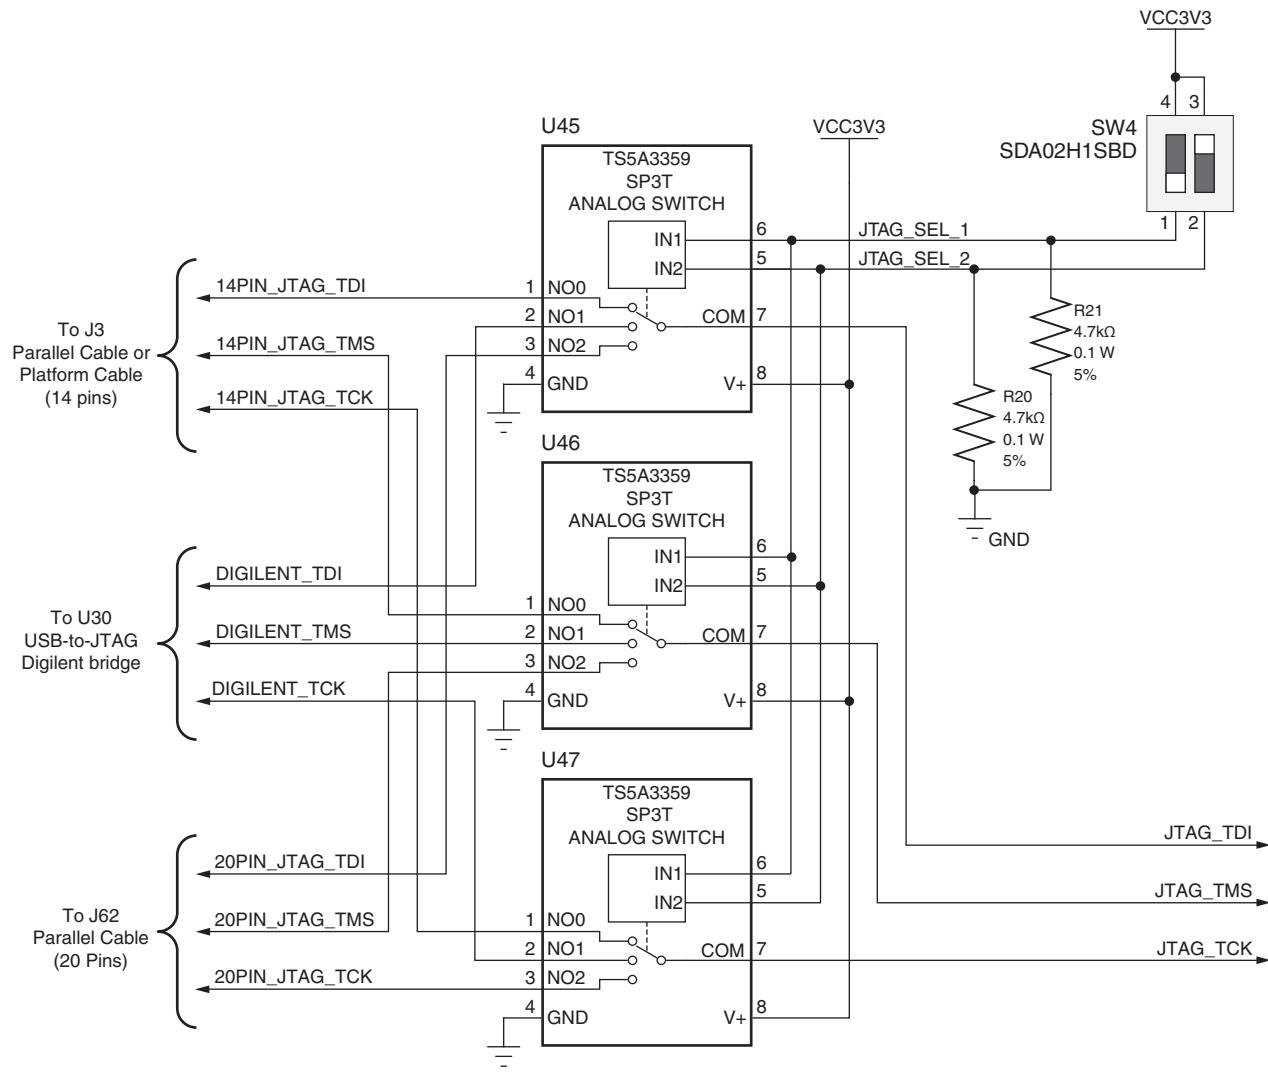

Figure 1-11: PL JTAG Programming Source Analog Switch

DIP switch SW4[1:2] setting 10 selects the 14-pin header J3 for configuration using either a Parallel Cable IV (PC4) or Platform Cable USB II. DIP switch SW4 setting 01 selects the USB-to-JTAG Digilent bridge U30 for configuration over a Standard-A to Micro-B USB cable. DIP switch SW4 setting 11 selects the JTAG 20-pin header at J62. The four JTAG signals TDI, TDO, TCK, and TMS would be connected to J62 through flying leads from a JTAG cable. The 3-to-1 analog switch settings are shown in [Table 1-11](#).

Table 1-11: Switch SW4 Configuration Option Settings

Configuration Source	DIP Switch SW4	
	Switch 1 ⁽¹⁾ JTAG_SEL_1	Switch 2 ⁽¹⁾ JTAG_SEL_2
None	0	0
Cable Connector J3 ⁽²⁾	1	0
Digilent USB-to-JTAG interface U30	0	1
JTAG (flying lead) Header J62	1	1

Notes:

1. 0 = open, 1 = closed
2. Default switch setting

FMC Connector JTAG Bypass

When an FPGA mezzanine card (FMC) is attached to HPC J37 or LPC J5 it is automatically added to the JTAG chain through electronically controlled single-pole single-throw (SPST) switches U32 and U31 respectively. The SPST switches are normally closed and transition to an open state when an FMC is attached. Switch U32 adds an attached FMC to the JTAG chain as determined by the FMC_HPC_PRSNT_M2C_B signal. Switch U31 adds an attached FMC to the JTAG chain as determined by the FMC_LPC_PRSNT_M2C_B signal. The attached FMC card must implement a TDI-to-TDO connection through a device or bypass jumper for the JTAG chain to be completed to the SoC U1.

The JTAG connectivity on the ZC706 board allows a host computer to download bitstreams to the SoC using the Xilinx® iMPACT software. In addition, the JTAG connector allows debug tools such as the Vivado serial I/O analyzer or a software debugger to access the SoC. The iMPACT software tool can also indirectly program the linear QSPI flash memory. To accomplish this, the iMPACT software configures the SoC with a temporary design to access and program the QSPI memory device.

Clock Generation

[Figure 1-3, callouts 7, 8, and 9]

The ZC706 evaluation board provides four clock sources for the XC7Z045 SoC. Table 1-12 lists the source devices for each clock.

Table 1-12: ZC706 Evaluation Board Clock Sources

Clock Name	Clock Source	Description
System Clock	U64	SiT9102 2.5V LVDS 200 MHz fixed-frequency oscillator (SiTime). See System Clock, page 36 .
User Clock	U37	Si570 3.3V LVDS I ² C programmable oscillator, 156.250 MHz default (Silicon Labs). See Programmable User Clock, page 37 .
User SMA Clock	J67(P), J68(N)	User clock input SMAs, limit input swing voltage to VADJ_FPGA setting (1.8V, 2.5V, 3.3V). See User SMA Clock Source, page 38 .
PS Clock	U24	SIT8103 1.8V single-ended CMOS 33.3333 MHz fixed frequency oscillator (SiTime). See Processing System Clock Source, page 39 .
GTX SMA REF Clock	J36(P), J31(N)	User clock input SMAs. See GTX SMA Clock (SMA_MGT_REFCLK_P and SMA_MGT_REFCLK_N), page 39 .
Jitter Attenuated Clock	U60	Si5324C LVDS precision clock multiplier/jitter attenuator (Silicon Labs). See Jitter Attenuated Clock, page 40 .

[Table 1-13](#) lists the pin-to-pin connections from each clock source to the XC7Z045 SoC.

Table 1-13: Clock Connections, Source to XC7Z045 SoC

Clock Source Pin	Net Name	I/O Standard	XC7Z045 (U1) Pin
U64.5	SYSCLK_N	LVDS	G9
U64.4	SYSCLK_P	LVDS	H9
U37.5	USRCLK_N	LVDS_25	AG14
U37.4	USRCLK_P	LVDS_25	AF14
J67.1	USER_SMA_CLOCK_P	LVDS_25	AD18
J68.1	USER_SMA_CLOCK_N	LVDS_25	AD19
J24.3	PS_CLK	NA(1)	A22 (Bank 500)
J36.1	SMA_MGT_REFCLK_P	NA(1)	W8
J31.1	SMA_MGT_REFCLK_N	NA(1)	W7
U60.29	SI5324_OUT_C_N	NA(1)	AC7
U60.28	SI5324_OUT_C_P	NA(1)	AC8
U60.17	REC_CLOCK_C_N	LVDS_25	AE20
U60.16	REC_CLOCK_C_P	LVDS_25	AD20
U60.3	SI5324_INT_ALM_LS	LVCMOS25	AJ25
U60.1	SI5324_RST_LS	LVCMOS25	W23

Notes:

1. PS-side and GTX nets do not have an assigned I/O standard.

System Clock

[[Figure 1-3](#), callout 7]

The system clock source is an LVDS 200 MHz oscillator at U64. It is wired to a multi-region clock capable (MRCC) input on programmable logic (PL) bank 34. The signal pair is named SYSCLK_P and SYSCLK_N and each signal is connected to U1 (pins H9 and G9, respectively) on the XC7Z045 SoC.

- Oscillator: SiTime SiT9102AI-243N25E200.00000 (200 MHz)
- Frequency tolerance: 50 ppm
- LVDS Differential Output

The system clock circuit is shown in [Figure 1-12](#).

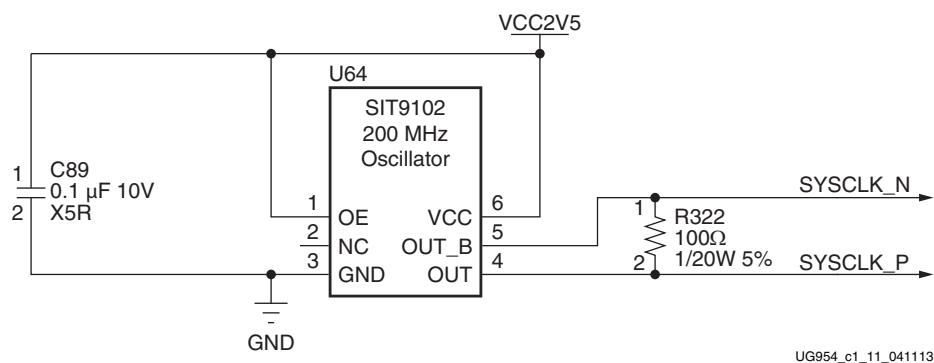

Figure 1-12: System Clock Source

For more details, see the SiTime SiT9102 data sheet [\[Ref 21\]](#).

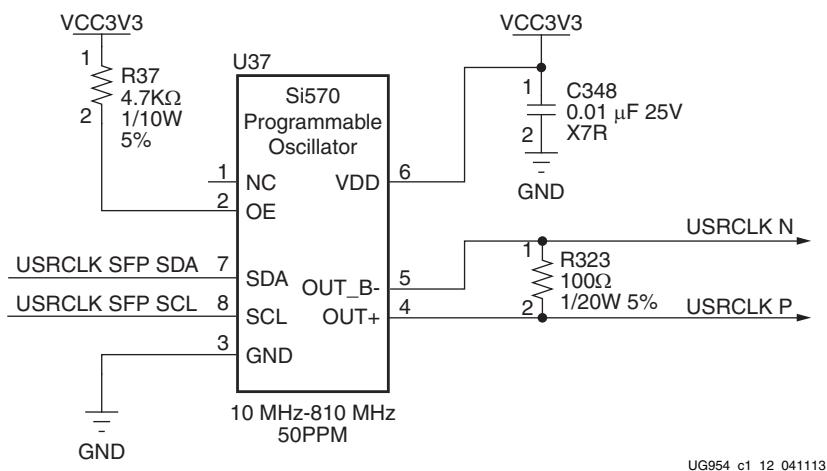

Programmable User Clock

[[Figure 1-3](#), callout 8]

The ZC706 evaluation board has a programmable low-jitter 3.3V LVDS differential oscillator (U37) connected to the MRCC inputs of bank 10. This USRCLK_P and USRCLK_N clock signal pair is connected to XC7Z045 SoC U1 pins AF14 and AG14, respectively. On power-up the user clock defaults to an output frequency of 156.250 MHz. User applications can change the output frequency within the range of 10 MHz to 810 MHz through an I²C interface. Power cycling the ZC706 evaluation board reverts the user clock to the default frequency of 156.250 MHz.

- Programmable Oscillator: Silicon Labs Si570BAB0000544DG (10 MHz–810 MHz)
- Frequency tolerance: 50 ppm
- LVDS Differential Output

The user clock circuit is shown in [Figure 1-13](#).

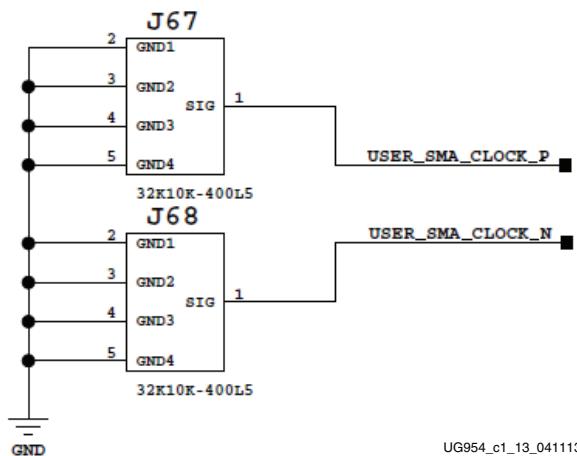

UG954_c1_12_041113

Figure 1-13: User Clock Source

See the Silicon Labs Si570 data sheet [[Ref 22](#)].

User SMA Clock Source

The ZC706 board provides a pair of SMAs for differential user clock input into PL Bank 9 (see [Figure 1-14](#)). The P-side SMA J67 signal USER_SMA_CLOCK_P is connected to U1 pin AD18, with the N-side SMA J68 signal USER_SMA_CLOCK_N connected to U1 pin AD19. Bank 9 V_{cco} is VADJ_FPGA, a variable voltage (1.8V, 2.5V, 3.3V) depending on the ZC706 FMC interface banks voltage. The USER_SMA_CLOCK input voltage swing should not exceed the board VADJ_FPGA voltage setting.

UG954_c1_13_041113

Figure 1-14: User SMA Clock

Processing System Clock Source

The Processing System (PS) clock source is a 1.8V LVC MOS single-ended fixed 33.33333 MHz oscillator at U24. It is wired to PS bank 500, pin A22 (PS_CLK), on the XC7Z045 SoC.

- Oscillator: SiTime SiT8103AC-23-18E-33.33333 (33.3 MHz)
- Frequency tolerance: 50 ppm
- Single-ended output

The system clock circuit is shown in [Figure 1-15](#).

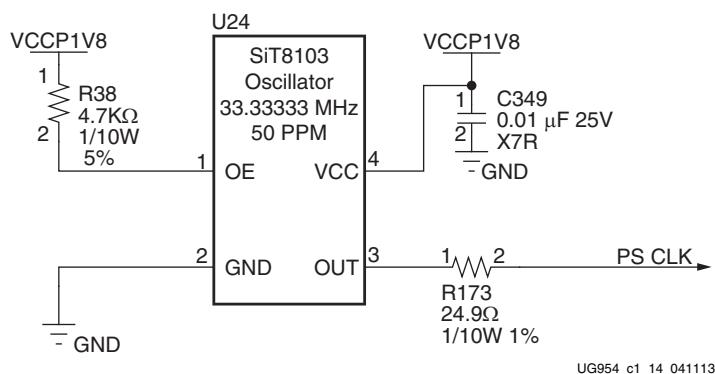

Figure 1-15: Processing System Clock Source

For more details, see the SiTime SiT8103 data sheet [\[Ref 21\]](#).

GTX SMA Clock (SMA_MGT_REFCLK_P and SMA_MGT_REFCLK_N)

[[Figure 1-3](#), callout 10]

The ZC706 board includes a pair of SMA connectors for a GTX clock wired to GTX Quad bank 111. This differential clock has signal names SMA_MGT_REFCLK_P and SMA_MGT_REFCLK_N, which are connected to SoC U1 pins W8 and W7 respectively.

- External user-provided GTX reference clock on SMA input connectors
- Differential Input

Figure 1-16 shows this AC-coupled clock circuit.

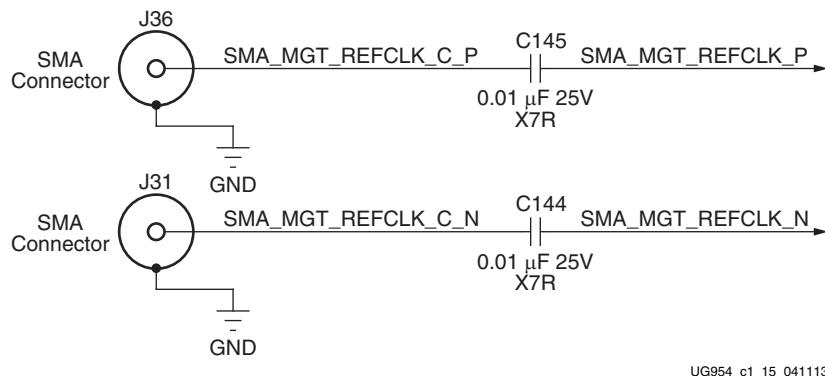

Figure 1-16: GTX SMA Clock Source

Jitter Attenuated Clock

[Figure 1-3, callout 11]

The ZC706 board includes a Silicon Labs Si5324 jitter attenuator U60 on the back side of the board. SoC user logic can implement a clock recovery circuit and then output this clock to a differential I/O pair on I/O bank 9 (REC_CLOCK_C_P, SoC U1 pin AD20 and REC_CLOCK_C_N, SoC U1 pin AE20) for jitter attenuation. The jitter attenuated clock (Si5324_OUT_C_P, Si5324_OUT_C_N) is then routed as a reference clock to GTX Quad 110 inputs MGTRREFCLK1P (SoC U1 pin AC8) and MGTRREFCLK1N (SoC U1 pin AC7).

The primary purpose of this clock is to support CPRI/OBSAI applications that perform clock recovery from a user-supplied SFP/SFP+ module and use the jitter attenuated recovered clock to drive the reference clock inputs of a GTX transceiver. The jitter attenuated clock circuit is shown in Figure 1-17.

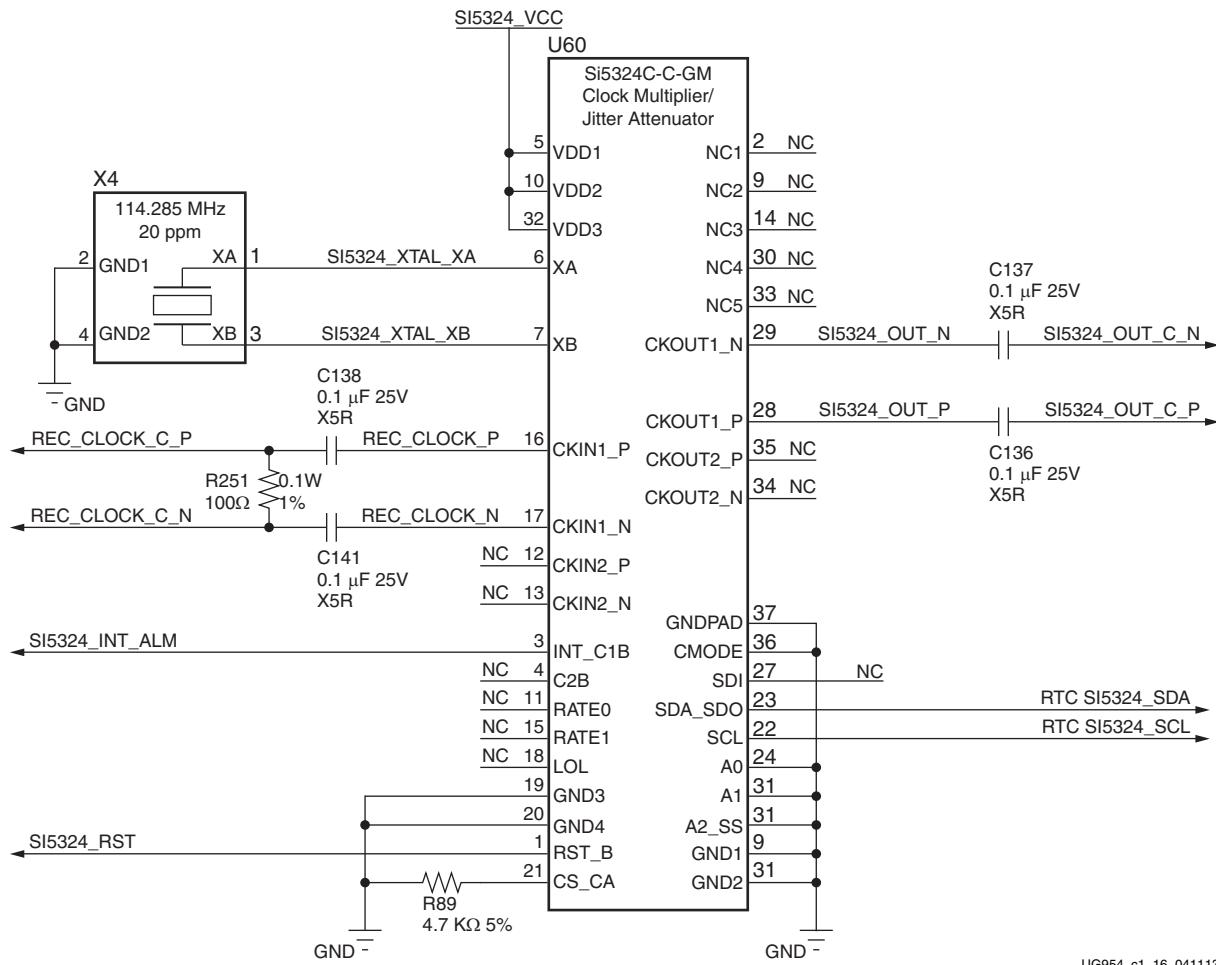

Figure 1-17: Jitter Attenuated Clock

See the Silicon Labs Si5324 data sheet [Ref 22].

GTX Transceivers

[Figure 1-3, callout 12]

The ZC706 board provides access to 16 GTX transceivers:

- Four of the GTX transceivers are wired to the PCI Express x4 endpoint edge connector (P4) fingers
- Eight of the GTX transceivers are wired to the FMC HPC connector (J37)
- One GTX transceiver is wired to the FMC LPC connector (J5)
- One GTX transceiver is wired to SMA connectors (RX: J32, J33 TX: J35, J34)
- One GTX transceiver is wired to the SFP/SFP+ Module connector (P2)

- One GTX transceiver is unused and is wired in a capacitively coupled TX-to-RX loopback configuration

The GTX transceivers in Zynq-7000 series SoCs are grouped into four channels described as Quads. The reference clock for a Quad can be sourced from the Quad above or Quad below the GTX Quad of interest. There are four GTX Quads on the ZC706 board with connectivity as shown here:

- Quad 109:
 - MGTREFCLK0 - FMC_HPC_GBTCLK0_M2C clock
 - MGTREFCLK1 - not connected
 - Contains 4 GTX transceivers allocated to FMC_HPC_DP[3:0]_C2M_P/N
- Quad 110:
 - MGTREFCLK0 - FMC_HPC_GBTCLK1_M2C clock
 - MGTREFCLK1 - SI5324_OUT_C_P/N jitter attenuator clock
 - Contains 4 GTX transceivers allocated to FMC_HPC_DP[7:4]_C2M_P/N
- Quad 111:
 - MGTREFCLK0 - FMC_LPC_GBTCLK0_M2C_C_P/N
 - MGTREFCLK1 - SMA_MGT_REFCLK_P/N SMA GTX clock input
 - Contains 1 GTX transceiver allocated to FMC_LPC_DP0_C2M_P/N
 - Contains 1 GTX transceiver allocated to SMA_MGT_TX_P/N and RX_P/N SMA connectors
 - Contains 1 GTX transceiver allocated to SFP_TX and _RX_P/N SFP/SFP+ connector
 - Contains 1 GTX transceiver which is unused and is wired in TX-to-RX loopback configuration
- Quad 112:
 - MGTREFCLK0 - PCIE_CLK_Q0_P/N PCIe edge connector clock
 - MGTREFCLK1 - not connected
 - Contains 4 GTX transceivers allocated to PCIe lanes 0-3

Table 1-15 lists the GTX Banks 109 and 110 interface connections between the SoC U1 and FMC HPC connector J37.

Table 1-14: SoC GTX Banks 109 and 110 Interface Connections to FMC HPC J37

Transceiver Bank	SoC U1 Pin Number	SoC U1 Pin Name	Schematic Net Name	Connected Pin	Connected Device

	W7	MGTREFCLK1N_111	SMA_MGT_REFCLK_N ⁽²⁾	J31.1	

Notes:

1. SoC U1 GTX input clock nets are capacitively coupled to the FMC LPC J5 pins.
2. SoC U1 GTX input nets are capacitively coupled to the RX and MGT_REFCLK SMA pins.

For additional information on Zynq-7000 GTX transceivers, see *7 Series FPGAs GTX/GTH Transceivers User Guide* ([UG476](#)).

PCI Express Endpoint Connectivity

[Figure 1-3, callout 13]

The 4-lane PCI Express edge connector performs data transfers at the rate of 2.5 GT/s for a Gen1 application and 5.0 GT/s for a Gen2 application. The PCIe transmit and receive signal data paths have a characteristic impedance of $85\Omega \pm 10\%$. The PCIe clock is routed as a 100Ω differential pair.

The XC7Z045-2FFG900C SoC (-2 speed grade) included with the ZC706 board supports up to Gen2 x4.

The PCIe clock is input from the edge connector. It is AC coupled to the SoC through the MGTREFCLK0 pins of Quad 112. PCIE_CLK_Q0_P is connected to SoC U1 pin N8, and the _N net is connected to pin N7. The PCIe clock circuit is shown in Figure 1-18.

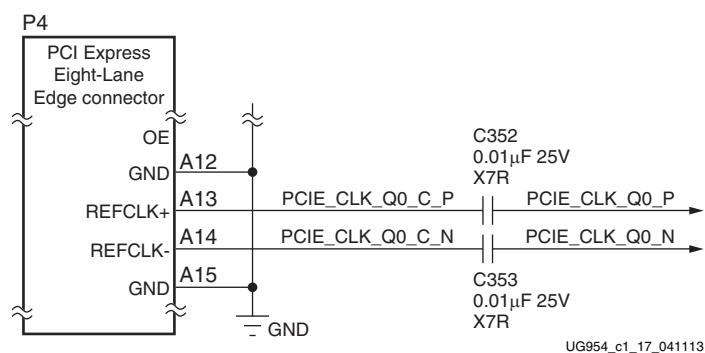

Figure 1-18: PCI Express Clock

PCIe lane width/size is selected by jumper J19 (Figure 1-18). The default lane size selection is 4-lane (J19 pins 3 and 4 jumpered).

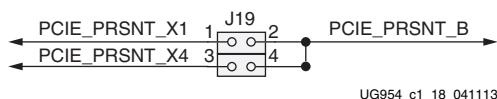

Figure 1-19: PCI Express Lane Size Select Jumper J19

Table 1-18 lists the GTX Bank 112 interface connections between the SoC U1 and PCIe 4-lane connector P4.

Table 1-16: SoC GTX Bank 112 Interface Connections to PCIe 4-Lane Connector P4

Transceiver Bank	SoC U1 Pin Number	SoC U1 Pin Name	Schematic Net Name	PCIe 4-Lane Conn. P4 Pin Number
GTX_BANK_112	T2	MGTPTXP0_112	PCIE_TX3_P	A29 (1)

Notes:

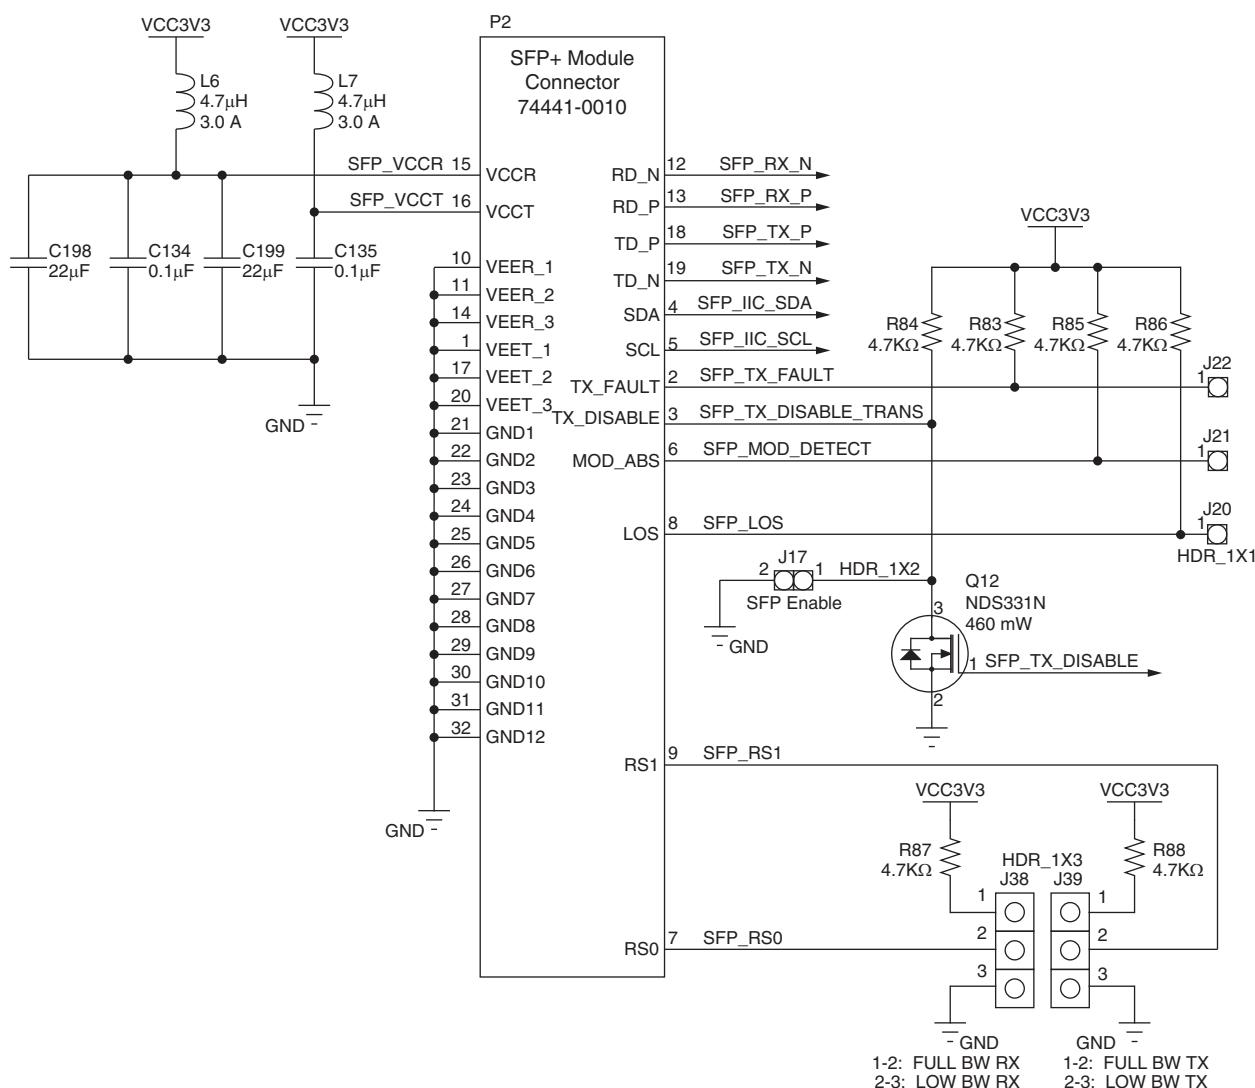

1. PCIE_TXn_P/N and PCIE_CLK_Q0_P/N are capacitively coupled to the PCIe edge connector P4.

For additional information about Zynq-7000 PCIe functionality, see *7 Series FPGAs Integrated Block for PCI Express Product Guide for Vivado Design Suite* ([PG054](#)). Additional information about the PCI Express standard is available [\[Ref 23\]](#).

SFP/SFP+ Module Connector

[Figure 1-3, callout 14]

The ZC706 board contains a small form-factor pluggable (SFP/SFP+) connector and cage assembly P2 that accepts SFP or SFP+ modules. Figure 1-20 shows the SFP/SFP+ module connector circuitry.

UG954_c1_19_041113

Figure 1-20: SFP+ Module Connector

Table 1-17 lists the SFP+ module RX and TX connections to the SoC.

Table 1-17: SoC U1 to SFP+ Module Connections

SoC (U1) Pin	Schematic Net name	SFP+ Module (P2)	
		Pin	Name
Y5	SFP_RX_N	12	RD_N
Y6	SFP_RX_P	13	RD_P
W4	SFP_TX_P	18	TD_P
W3	SFP_TX_N	19	TD_N
AA18	SFP_TX_DISABLE_TRANS	3	TX_DISABLE

Table 1-18 lists the SFP+ module control and status connections to the SoC.

Table 1-18: SFP+ Module Control and Status Connections

SFP Control/ Status Signal	Board Connection	
SFP_TX_FAULT	Test Point J23	High = Fault
		Low = Normal operation
SFP_TX_DISABLE	Jumper 17	Off = SFP Disabled
		On = SFP enabled
SFP_MOD_DETECT	Test Point J24	High = Module not present
		Low = Module present
SFP_RS0	Jumper 56	Jumper pins 1-2 = Full RX bandwidth
		Jumper pins 2-3 = Reduced RX bandwidth
SFP_RS1	Jumper 55	Jumper pins 1-2 = Full TX bandwidth
		Jumper pins 2-3 = Reduced TX bandwidth
SFP_LOS	Test Point J25	High = Loss of receiver signal
		Low = Normal operation

For additional information about the enhanced Small Form Factor Pluggable (SFP+) module, see the SFF-8431 specification [\[Ref 24\]](#).

10/100/1000 Mb/s Tri-Speed Ethernet PHY (PS)

[Figure 1-3, callout 15]

The ZC706 evaluation board uses the Marvell Alaska PHY device (88E1116R) at U51 for Ethernet communications at 10 Mb/s, 100 Mb/s, or 1000 Mb/s. The board supports RGMII mode only. The PHY connection to a user-provided Ethernet cable is through a Halo HFJ11-1G01E RJ-45 connector (P3) with built-in magnetics.

On power-up, or on reset, the PHY is configured to operate in RGMII mode with PHY address 0b00111 using the settings shown in [Table 1-19](#). These settings can be overwritten via software commands passed over the MDIO interface.

Table 1-19: Board Connections for PHY Configuration Pins

U51 Pin	Setting	Configuration	
CONFIG (64)	VCCP1V8	PHYAD[1]=1	PHYAD[0]=1
CONFIG1 (1)	PHY_LED0	PHYAD[3]=0	PHYAD[2]=1
CONFIG2 (2)	GND	ENA_XC=0	PHYAD[4]=0
	PHY_LED0	ENA_XC=0	PHYAD[4]=1
	VCCP1V8	ENA_XC=1	PHYAD[4]=1
CONFIG3 (3)	GND	RGMII_TX=0	RGMII_RX=0
	PHY_LED0	RGMII_TX=0	RGMII_RX=1
	PHY_LED1	RGMII_TX=1	RGMII_RX=0
	VCCP1V8	RGMII_TX=1	RGMII_RX=1

The Ethernet connections from the XC7Z045 SoC at U1 to the 88E1116R PHY device at U51 are listed in [Table 1-20](#).

Table 1-20: Ethernet Connections, XC7Z045 SoC to the PHY Device

XC7Z045 (U1) Pin			Schematic Net Name	M88E1116R PHY U51

Ethernet PHY Clock Source

A 25.00 MHz 50 ppm crystal at X1 is the clock source for the 881116R PHY at U51. [Figure 1-21](#) shows the clock source.

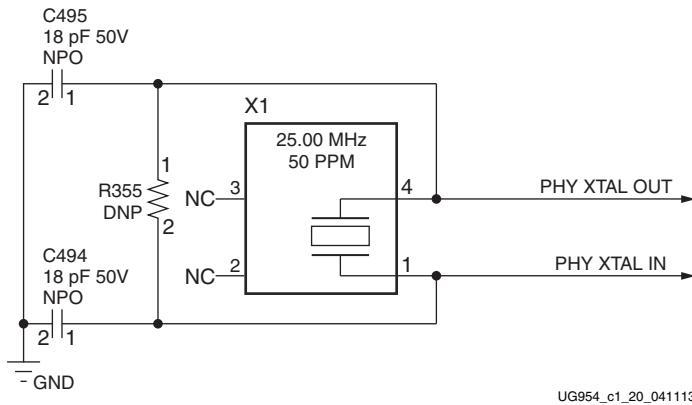

Figure 1-21: Ethernet PHY Clock Source

The data sheet can be obtained under NDA with Marvell. Contact information can be found at their website [\[Ref 25\]](#).

For additional information on the Zynq-7000 SoC device gigabit Ethernet controller, see *Zynq-7000 SoC Overview* ([DS190](#)) and *Zynq-7000 SoC Technical Reference Manual* ([UG585](#)).

USB-to-UART Bridge

[[Figure 1-3](#), callout 17]

The ZC706 evaluation board contains a Silicon Labs CP2103GM USB-to-UART bridge device (U52) which allows a connection to a host computer with a USB port. The USB cable is supplied in the ZC706 evaluation kit (Standard-A end to host computer, Type Mini-B end to ZC706 evaluation board connector J21). The CP2103GM is powered by the USB 5V provided by the host PC when the USB cable is plugged into the USB port on the ZC706 evaluation board.

The CP2013GM TX and RX pins are wired to the UART_1 IP block within the XC7Z045 SoC PS I/O Peripherals set. The XC7Z045 SoC supports the USB-to-UART bridge using two signal pins: Transmit (TX) and Receive (RX).

Silicon Labs provides royalty-free Virtual COM Port (VCP) drivers for the host computer. These drivers permit the CP2103GM USB-to-UART bridge to appear as a COM port to communications application software (for example, TeraTerm or HyperTerm) that runs on the host computer. The VCP device drivers must be installed on the host PC prior to establishing communications with the ZC706 evaluation board.

The USB Connector pin assignments and signal definitions between J21 and U52 are listed in [Table 1-21](#).

Table 1-21: USB Connector J21 Pin Assignments and Signal Definitions

USB Connector (J21)		Net Name	Description	CP2103GM (U52)	
Pin	Name			Pin	Name
1	VBUS	USB_UART_VBUS	+5V VBUS Powered	7	REGIN
				8	VBUS
2	D_N	USB_UART_D_N	Bidirectional differential serial data (N-side)	4	D -
3	D_P	USB_UART_D_P	Bidirectional differential serial data (P-side)	3	D +
5	GND	USB_UART_GND	Signal ground	2	GND1
				29	CNR_GND

Table 1-22 lists the USB connections between the XC7Z045 SoC PS Bank 501 and the CP2103 UART bridge.

Table 1-22: XC7Z045 SoC to CP2103 Connections

XC7045 SoC (U1)						Schematic Net Name	CP2103GM Device (U52)		
Pin Name	Bank	PIN	Function	Direction	IOSTANDARD		PIN	Function	Direction
PS_MIO48	501	C19	TX	Output	LVCMOS18	USB_UART_RX	24	RXD	Input
PS_MIO49	501	D18	RX	Input	LVCMOS18	USB_UART_TX	25	TXD	Output

Refer to the Silicon Labs website for technical information on the CP2103GM and the VCP drivers [Ref 22].

For additional information on the Zynq-7000 SoC device UART controller, see *Zynq-7000 SoC Overview (DS190)* and *Zynq-7000 SoC Technical Reference Manual (UG585)*.

HDMI Video Output

[Figure 1-3, callout 18]

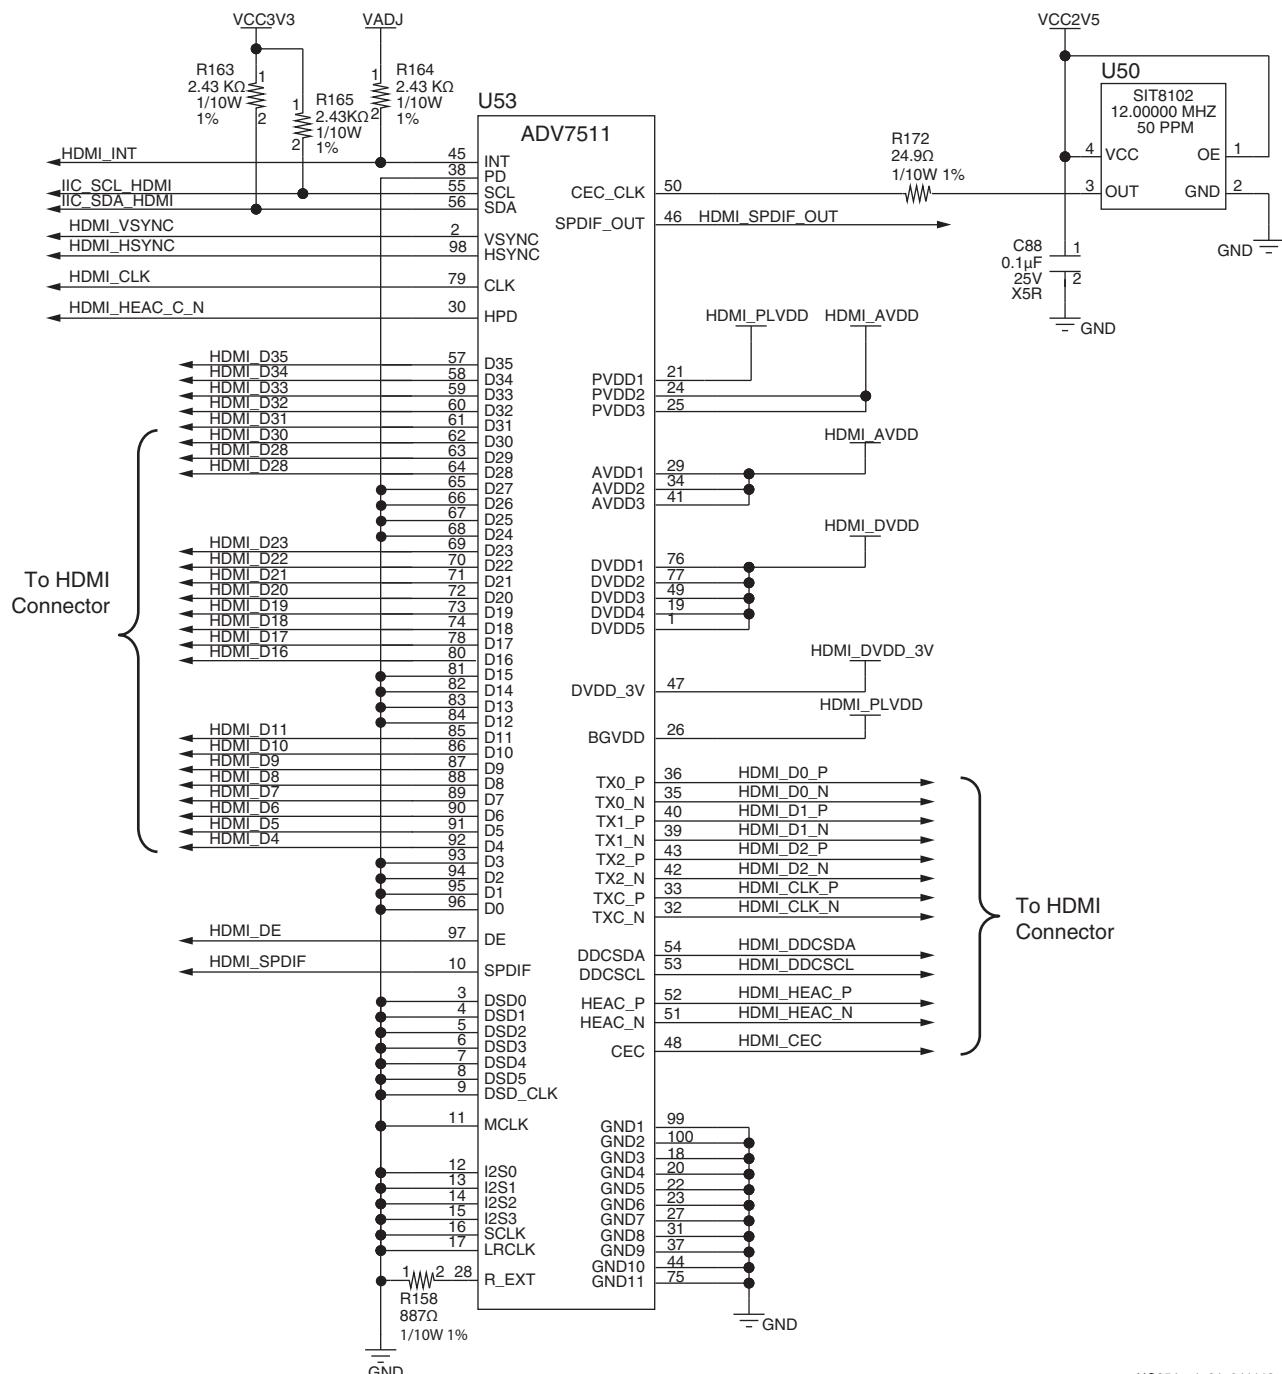

The ZC706 evaluation board provides a high-definition multimedia interface (HDMI®) video output using an Analog Devices ADV7511KSTZ-P HDMI transmitter at U53. The HDMI transmitter U53 is connected to the XC7Z045 SoC PL-side banks 12 and 13 and its output is provided on a Molex 500254-1927 HDMI type-A receptacle at P1. The ADV7511 supports 1080P 60Hz, YCbCr 4:4:4 encoding via 24-bit input data mapping.

The ZC706 evaluation board supports the following HDMI device interfaces:

- 24 data lines
- Independent VSYNC, HSYNC
- Single-ended input CLK
- Interrupt Out pin to XC7Z045 SoC

- I²C
- SPDIF

Figure 1-22 shows the HDMI codec circuit.

UG954_c1_21_041113

Figure 1-22: HDMI Codec Circuit

Information about the ADV7511KSTZ-P is available on the Analog Devices website [Ref 26].

For additional information about HDMI IP options, see the *LogiCORE IP DisplayPort Product Guide for Vivado Design Suite* ([PG064](#)).

I²C Bus

[Figure 1-3, callout 20]

The ZC706 evaluation board implements two I²C ports on the XC7Z045 SoC. The PL-side I²C port (IIC_SDA and _SCL_MAIN) is routed to level shifter U87. The PS-side I²C port (PS_SDA and _SCL_MAIN) is routed to level shifter U88. The "output" side of the two level shifters are wired to the common I²C bus IIC_SDA and _SCL_MAIN which is connected to TI Semiconductor PCA9548 1-to-8 channel I²C bus switch (U65). The bus switch can operate at speeds up to 400 kHz.

IMPORTANT: The PCA9548 U65 RESET_B pin 24 is connected to FPGA U1 bank 501 pin F20 via level-shifter U25. FPGA pin F20 net IIC_MUX_RESET_B_LS must be driven High to enable I²C bus transactions with the devices connected to U65.

The ZC706 evaluation board I²C bus topology is shown in [Figure 1-23](#).

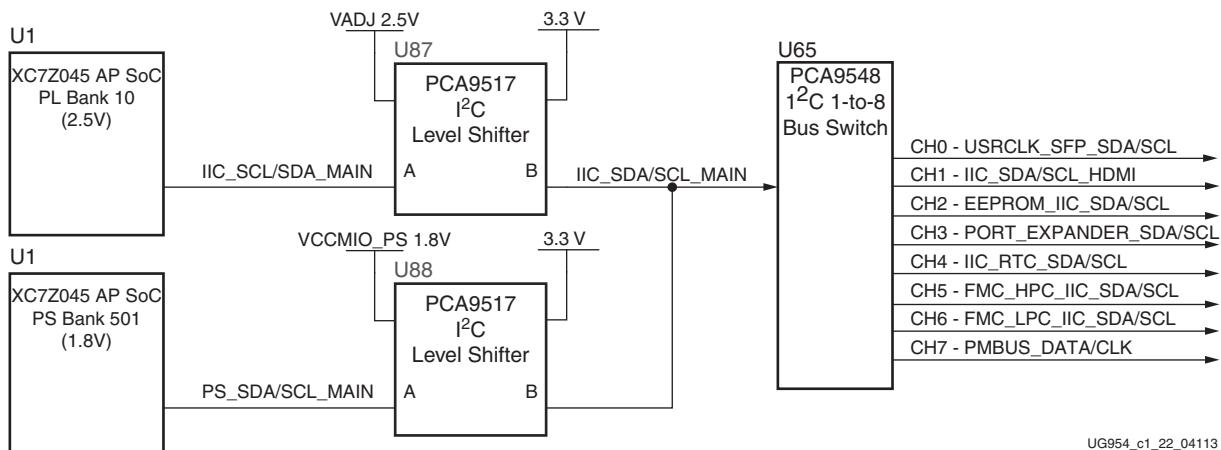

Figure 1-23: I²C Bus Topology

User applications that communicate with devices on one of the downstream I²C buses must first set up a path to the desired bus through the U65 bus switch at I²C address 0x74 (0b01110100). [Table 1-25](#) lists the address for each bus.

Table 1-25: I²C Bus Addresses

Device	I ² C Switch Position	I ² C Address	Device
PCA9548 8-Channel bus switch	NA	0b1110100	PCA9548 U65
Si570 clock	0	0b1011101	Si570 U37

UCD90120A pmbus	7	0b1100101	UCD90120A U48

Information about the PCA9548 is available on the TI Semiconductor website at [\[Ref 27\]](#).

For additional information on the Zynq-7000 SoC device I²C controller, see *Zynq-7000 SoC Overview* ([DS190](#)) and *Zynq-7000 SoC Technical Reference Manual* ([UG585](#)).

Real Time Clock (RTC)

The Epson RTC-8564JE (U26) is an I²C bus interface real-time clock that has a built-in 32.768 KHz oscillator with these features:

- Frequency output options: 32.768 KHz, 1,024 Hz, 32 Hz or 1 Hz
- Calendar output functions: Year, month, day, weekday, hour, minute and second
- Clock counter, alarm and fixed-cycle timer interrupt functions
- Back-up battery B3 Panasonic ML621S/DN, 3.0V rechargeable cell

Programming information for the RTC-8564JE is available in the *RTC-8564JE/NB Application Manual* [Ref 30].

Figure 1-24 shows the real time clock circuit.

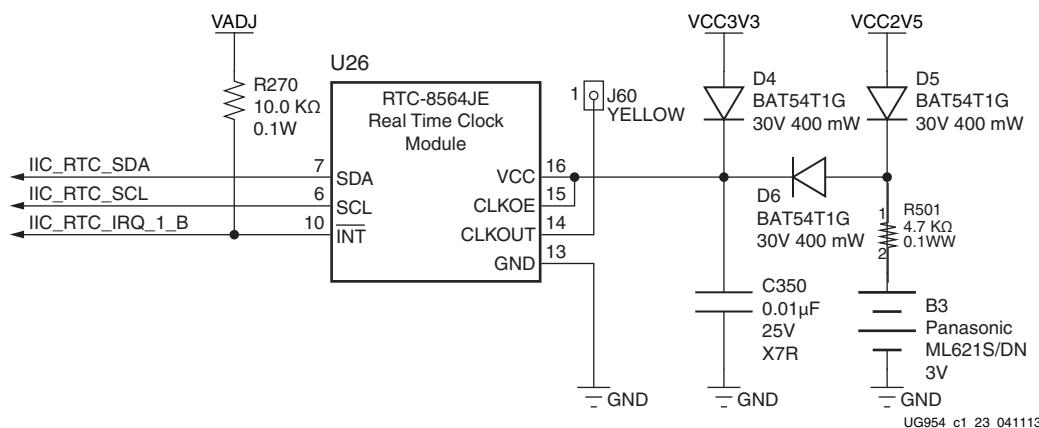

Figure 1-24: Real Time Clock Circuit

Real time clock connections to the XC7Z045 SoC and the PCA9548 8-Channel bus switch are listed in Table 1-26. Refer to Table 1-25 for the RTC I²C address.

Table 1-26: Real Time Clock Connections

RTC-8564JE (U16) Pin	Net Name	Connects To
6	IIC_RTC_SCL	U65.11 (PCA9548 SC4)
7	IIC_RTC_SDA	U65.10 (PCA9548 SD4)
10	IIC_RTC_IRQ_1_B	U1.AA17 (XC7Z045 SoC PL BANK 10)

Information about the RTC-8564JE is available at the Epson Electronics America website [Ref 31].

Status and User LEDs

Table 1-27 defines the status and user LEDs.

Table 1-27: Status LEDs

Reference Designator	Net Name	LED Color	Description
DS1	POR	RED	Processor System Power-ON reset is active
DS2	FPGA_INIT_B	GRN/RED	Green: FPGA initialization was successful Red: FPGA initialization is in progress
DS3	DONE	GRN	FPGA bit file download is complete

DS30	PHY_LED2	GRN	Ethernet PHY LED2
DS35	GPIO_LED_0	GRN	General Purpose user LED

Ethernet PHY User LEDs

[Figure 1-3, callout 21]

The three Ethernet PHY user LEDs shown in Figure 1-25 are located near the RJ45 Ethernet jack P3. The on/off state for each LED is software dependent and has no specific meaning at Ethernet PHY power on.

Refer to the Marvell 881116R Alaska Gigabit Ethernet transceiver data sheet for details concerning the use of the Ethernet PHY user LEDs. They are referred to in the data sheet as LED0, LED1, and LED2. See the data sheet and other product information for the Marvell 881116R Alaska Gigabit Ethernet Transceiver [Ref 25].

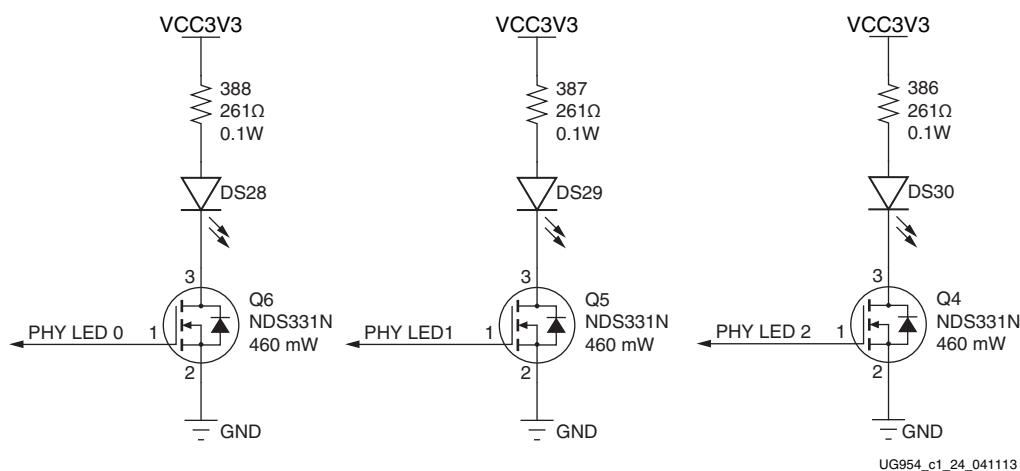

Figure 1-25: Ethernet PHY User LEDs

User I/O

[Figure 1-3, callout 22–24]

The ZC706 evaluation board provides the following user and general purpose I/O capabilities:

- Four user LEDs (callout 22)
 - GPIO_LED_LEFT DS8, GPIO_LED_CENTER DS9, GPIO_LED_RIGHT DS10, GPIO_LED_0 DS35
- Three user pushbuttons (callout 23)
 - GPIO_SW_LEFT SW7, GPIO_SW_CENTER SW9, GPIO_SW_RIGHT SW8
- PL CPU reset pushbutton
 - PL_CPU_RESET SW13
- 4-position user DIP Switch (callout 24)

- GPIO_DIP_SW[3:0] SW12
- Two user GPIO male pin headers (callout 26)
- 2 x 6 0.1 in. pitch PMOD1 J57
- 2 x 6 0.1 in. pitch PMOD2 J58

User LEDs

[Figure 1-3, callout 22]

The ZC706 evaluation board supports four user LEDs connected to XC7Z045 SoC Banks 11, 33, and 35. Figure 1-26 shows the user LED circuits.

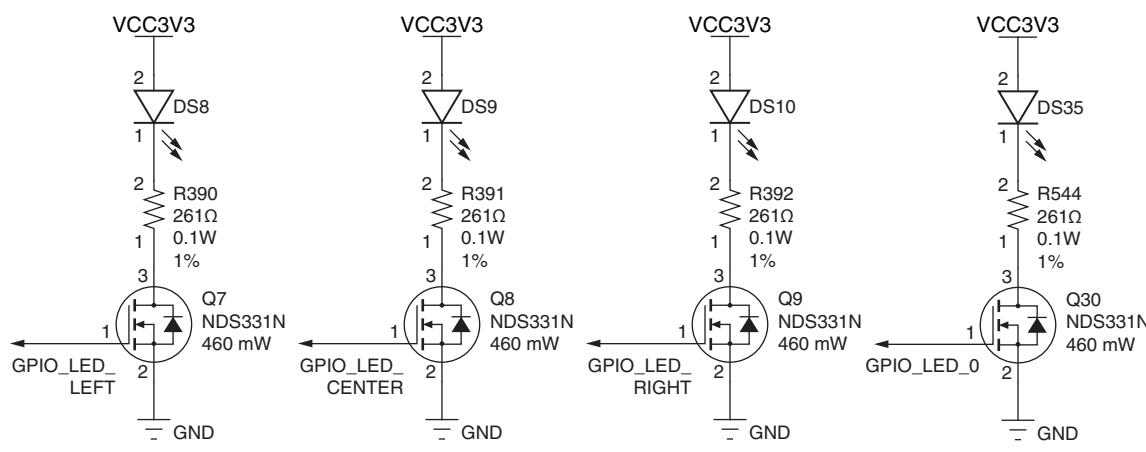

Figure 1-26: User LEDs

Table 1-28 lists the user LED connections to XC7Z045 SoC U1.

Table 1-28: User LED Connections to XC7Z045 SoC U1

XC7Z045 SoC (U1) Pin	Net Name	I/O Standard	LED Reference
Y21	GPIO_LED_LEFT	LVCMS25	DS8
G2	GPIO_LED_CENTER	LVCMS25	DS9
W21	GPIO_LED_RIGHT	LVCMS25	DS10
A17	GPIO_LED_0	LVCMS25	DS35

User Pushbuttons

[Figure 1-3, callout 23]

Figure 1-27 shows the user pushbutton circuits.

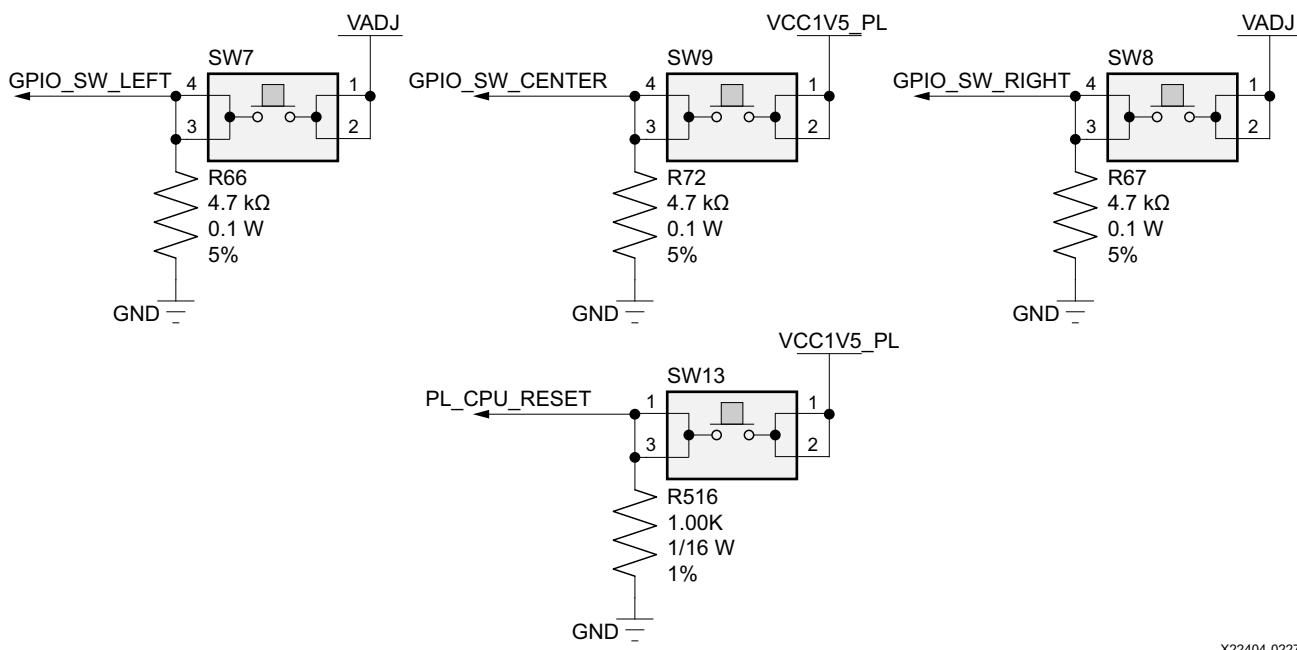

Figure 1-27: User Pushbuttons

Table 1-29 lists the user pushbutton connections to XC7Z045 SoC U1.

Table 1-29: User Pushbutton Connections to XC7Z045 SoC U1

XC7Z045 SoC (U1) Pin	Net Name	I/O Standard	Pushbutton Reference

AC17	GPIO_DIP_SW2	LVCMOS25	3
AJ13	GPIO_DIP_SW3	LVCMOS25	4

User PMOD GPIO Headers

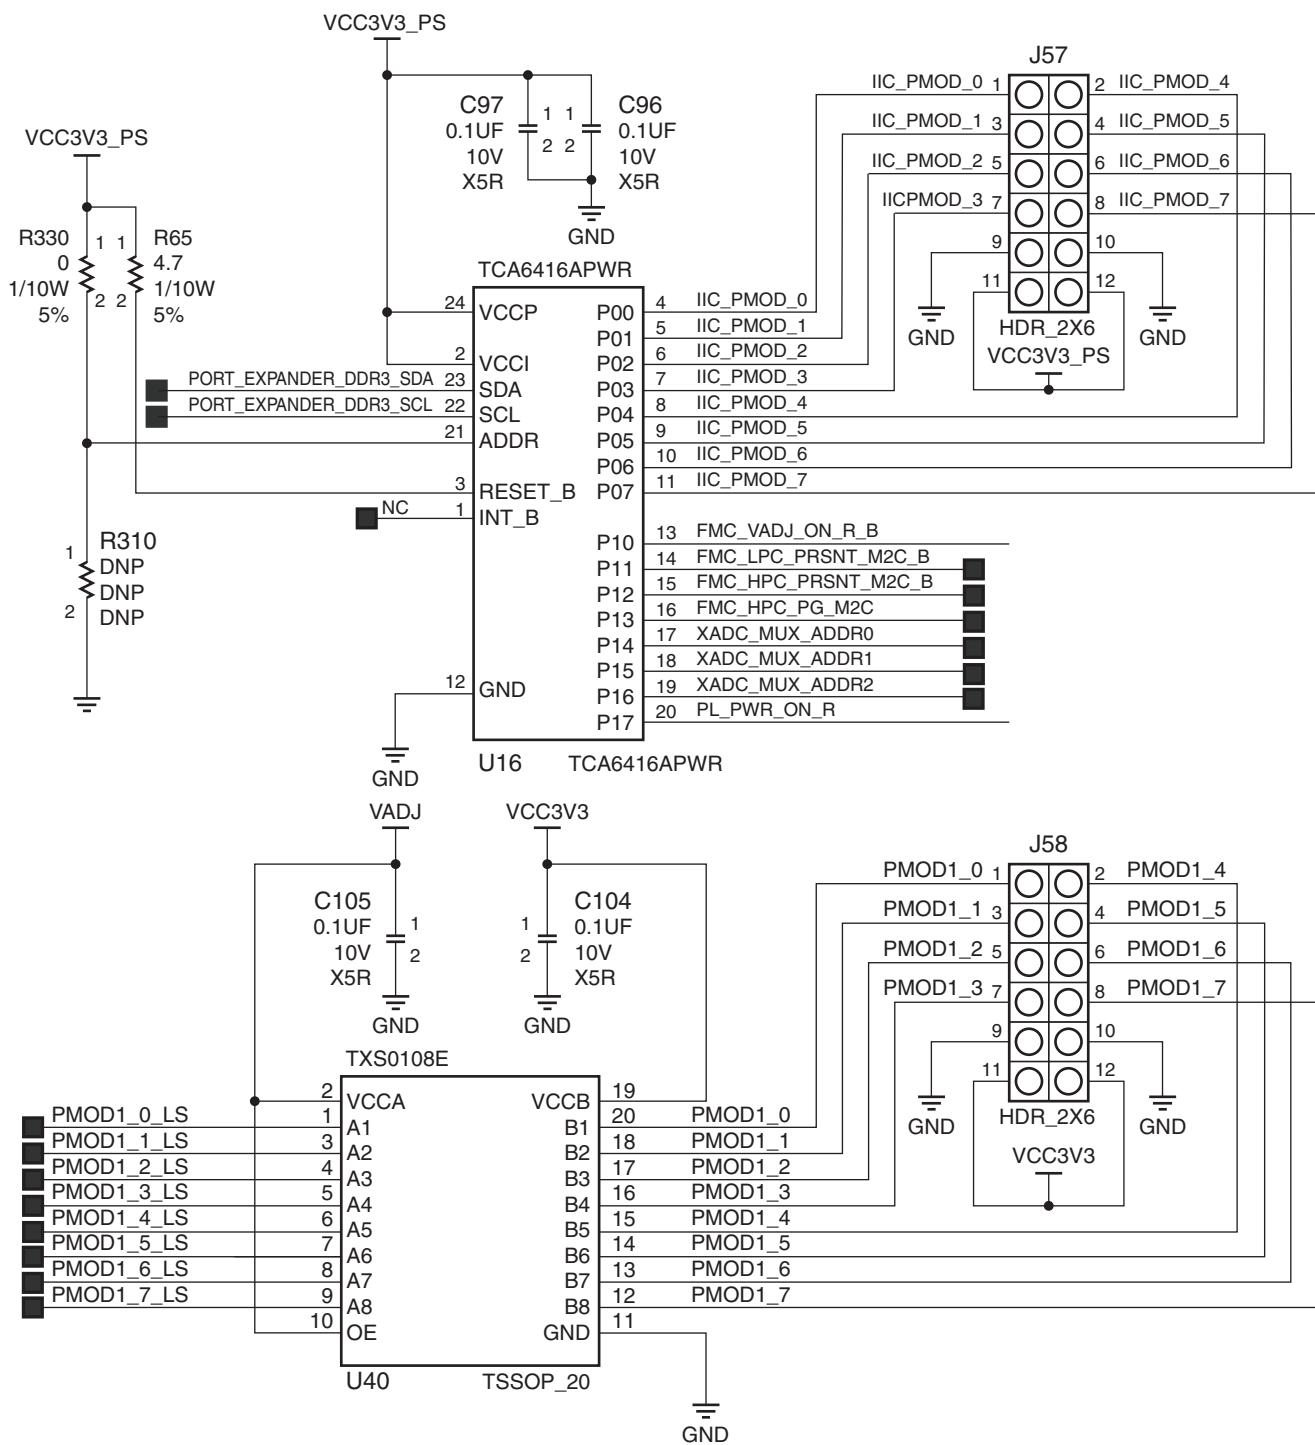

[Figure 1-3, callout 26]

The ZC706 evaluation board GPIO 2 x 6 male headers J57 and J58 support Digilent Pmod Peripheral Modules. J57 pins (IIC_PMOD_[0:7]) are connected to the TI TCA6416APWR I2C expansion port device U16. J58 pins (PMOD1_[0:7]) are connected to the TI TXS0108E 3.3V-to-VADJ level-shifter U40.

See the Digilent website for information on Digilent Pmod Peripheral Modules [Ref 36].

Information about the TCA641APWR and TXS0108E devices is available at the Texas Instruments website [Ref 27].

Figure 1-29 shows the user GPIO male pin header circuits.

UG954_c1_28_031715

Figure 1-29: User GPIO Headers

[Table 1-31](#) lists the GPIO Header connections to XC7Z045 SoC U1.

Table 1-31: GPIO Header Connections to XC7Z045 SoC at U1

TCA6416APWR (U16) PORT: Pin	Net Name	GPIO Header J57 Pin
P00:4	IIC_PMOD_0	J57.1

AC19	PMOD1_7	J58.8

See *Zynq-7000 SoC Technical Reference Manual* ([UG585](#)) for information about the PS PJTAG functionality.

Switches

The ZC706 evaluation board includes a power and a configuration (PL PROG_B) switch:

- Power On/Off slide switch SW1 (callout [27](#))
- SW10 (FPGA_PROG_B), active-Low pushbutton (callout [28](#))
- PS System Reset Pushbuttons

Power On/Off Slide Switch

[[Figure 1-3](#), callout 27]

The ZC706 evaluation board power switch is SW1. Sliding the switch actuator from the Off to On position applies 12V power from J22 a 6-pin mini-fit connector. Green LED DS22 illuminates when the ZC706 evaluation board power is on. See [Power Management](#) for details on the onboard power system.

CAUTION! Do NOT plug a PC ATX power supply 6-pin connector into J22 on the ZC706 Evaluation Board. The ATX 6-pin connector has a different pinout than J22. Connecting an ATX 6-pin connector into J22 will damage the ZC706 Evaluation Board and void the board warranty.

The ZC706 evaluation kit provides the adapter cable shown in [Figure 1-30](#) for powering the ZC706 board from the ATX power supply 4-pin peripheral connector. The Xilinx part number for this cable is 2600304, and is equivalent to Sourcegate Technologies part number AZCBL-WH-1109-RA4. For information on ordering this cable, see [\[Ref 37\]](#).

UG954_c1_29_041113

Figure 1-30: ATX Power Supply Adapter Cable

[Figure 1-31](#) shows the power connector J22, power switch SW1 and indicator LED DS22.

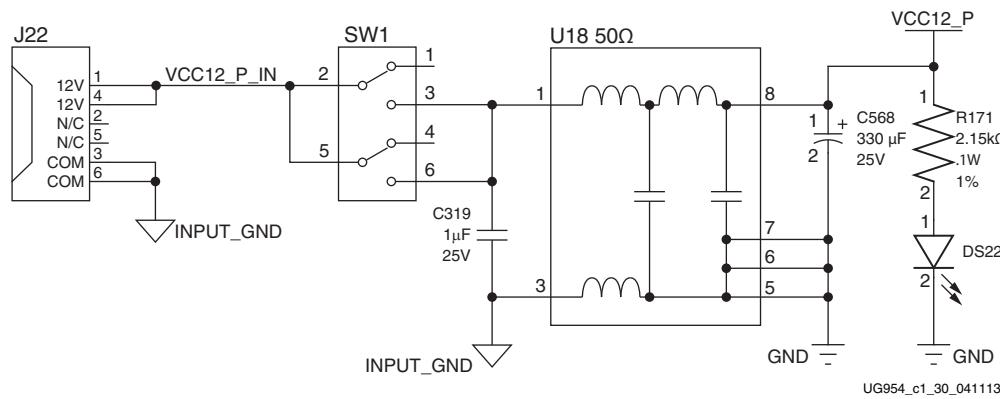

Figure 1-31: Power On/Off Switch SW1

Program_B Pushbutton

[[Figure 1-3](#), callout 28]

Switch SW10 grounds the XC7Z045 SoC PROG_B pin when pressed. This action clears the programmable logic configuration. The FPGA_PROG_B signal is connected to XC7Z045 SoC U1 pin Y9.

See *7 Series FPGAs Configuration User Guide*, ([UG470](#)) for further details on configuring the 7 series FPGAs.

Figure 1-32 shows SW10.

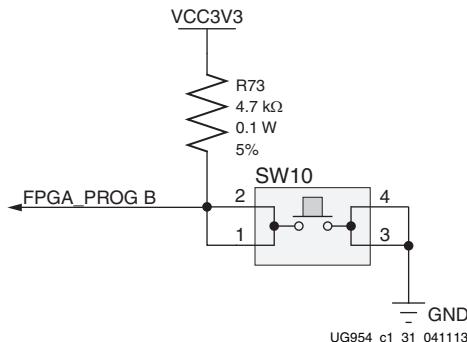

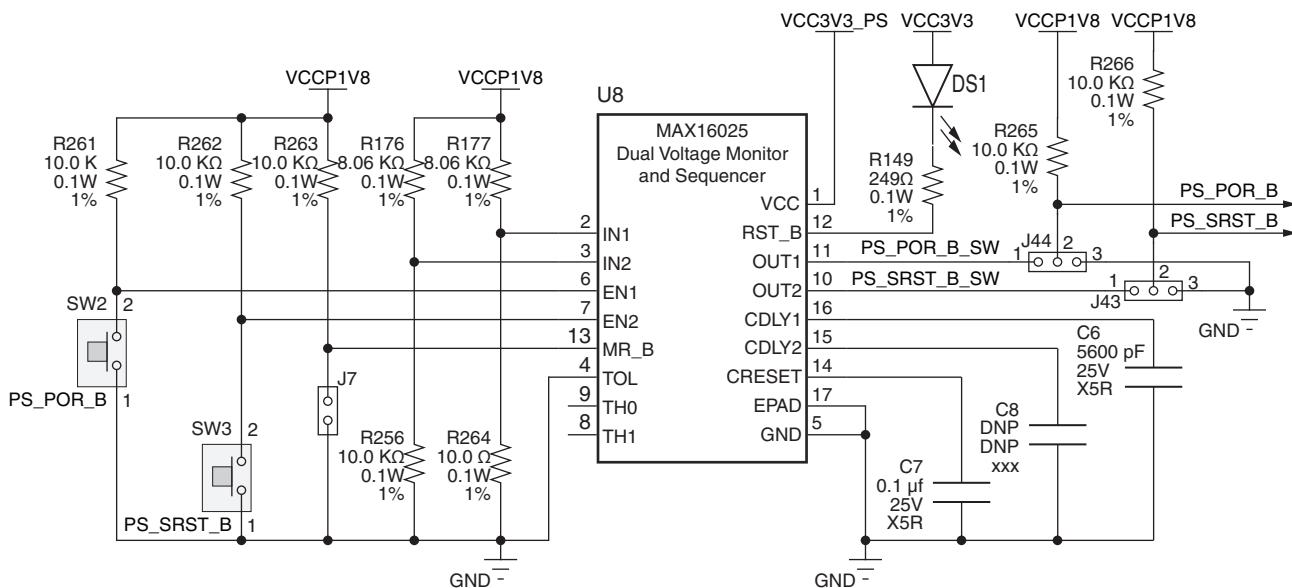

Figure 1-32: PROG_B Pushbutton SW10

PS Power-On and System Reset Pushbuttons

Figure 1-33 shows the reset circuitry for the processing system.

C8 = DNP, SRST delay = 35 μ s
C6 = 5600 pF, POR delay = 22.4 ms

UG954_c1_32_032916

Figure 1-33: PS Power On and System Reset Circuitry

Depressing and then releasing pushbutton SW1 causes PS_POR_B_SW to strobe low.

PS_POR_B: This reset is used to hold the PS in reset until all PS power supplies are at the required voltage levels. It must be held Low through PS power-up. PS_POR_B should be generated by the power supply *power-good* signal.

Depressing and then releasing pushbutton SW3 causes PS_SRST_B_SW (connected to the XC7Z045 SoC U1 dedicated PS Bank 500 pin D21) to strobe low.

PS_SRST_B: This reset is used to force a system reset. It can be tied or pulled High, and can be High during the PS supply power ramps.

See *Zynq-7000 SoC Technical Reference Manual* ([UG585](#)) for information concerning the resets.

FPGA Mezzanine (FMC) Card Interface

[[Figure 1-3](#), callout 30 and 31]

The ZC706 evaluation board supports the VITA 57.1 FPGA Mezzanine Card (FMC) specification by providing subset implementations of the high pin count (HPC) connector at J37 and low pin count (LPC) version at J5. Both connectors use a 10 x 40 form factor. The HPC connector is populated with 400 pins, while the LPC connector is partially populated with 160 pins. The connectors are keyed so that a mezzanine card, when installed in either of these FMC connectors on the ZC706 evaluation board, faces away from the ZC706 board.

Connector Type:

- Samtec SEAF Series, 1.27 mm (0.050 in) pitch. Mates with SEAM series connector

More information about SEAF series connectors is available at the Samtec website [[Ref 32](#)]. More information about the VITA 57.1 FMC specification is available at the VITA FMC Marketing Alliance website [[Ref 38](#)].

HPC Connector J37

[[Figure 1-3](#), callout 30]

The 400-pin HPC connector defined by the FMC specification ([Figure B-2, page 93](#)) provides connectivity for up to:

- 160 single-ended or 80 differential user-defined signals
- 10 GTX transceivers
- 2 GTX clocks
- 4 differential clocks
- 159 ground and 15 power connections

The connections between the HPC connector at J37 and SoC U1 ([Table 1-32](#)) implements a subset of this connectivity:

- 34 differential user-defined pairs (34 LA pairs, LA00–LA33)

- 8 GTX transceivers
- 2 GTX clocks
- 2 differential clocks
- 159 ground and 15 power connections

The ZC706 board V_{ADJ} voltage for the J37 and J5 connectors is determined by the FMC V_{ADJ} power sequencing logic described in the [Power Management, page 79](#).

Note: HPC FMC (J37) GA0 = GA1 = 0 = GND.

[Table 1-32](#) shows the J37 HPC FMC to SoC U1 connections.

Notes:

1. No I/O standards are associated with MGT connections.

LPC Connector J5

[Figure 1-3, callout 31]

The 160-pin LPC connector defined by the FMC specification (Figure B-1, page 92) provides connectivity for up to:

- 68 single-ended or 34 differential user-defined signals
- 1 GTX transceiver

- 1 GTX clock
- 2 differential clocks
- 61 ground and 10 power connections

The connections between the HPC connector at J5 and SoC U1 implements a subset of this connectivity:

- 34 differential user-defined pairs (34 LA pairs, LA00–LA33)
- 1 GTX transceiver
- 1 GTX clock
- 2 differential clocks
- 61 ground and 9 power connections

Note: LPC FMC (J5) GA0 = GA1 = 0 = GND.

Table 1-33 shows the FMC LPC connections between J5 and XC7Z045 SoC U1.

ZC706 Board Power System

The ZC706 board hosts a power system based on the Texas Instruments (TI) UCD90120A power supply sequencer and monitor, and the LMZ31500 and LMZ31700 family voltage regulators.

UCD90120A Description

The UCD90120A is a 12-rail PMBus/I²C addressable power-supply sequencer and monitor. The device integrates a 12-bit ADC for monitoring up to 12 power-supply voltage inputs. Twenty-six GPIO pins can be used for power supply enables, power-on reset signals, external interrupts, cascading, or other system functions. Twelve of these pins offer pulse width modulation (PWM) functionality. Using these pins, the UCD90120A offers support for margining and general purpose PWM functions.

The TI Fusion Digital Power™ designer software is provided for device configuration. This PC-based graphical user interface (GUI) offers an intuitive interface for configuring, storing, and monitoring all system operating parameters.

LMZ31500 and LMZ31700 Family Regulator Description

The LMZ31520 SIMPLE SWITCHER® power module is a step-down DC-DC solution capable of driving up to 20A load. The LMZ31520 module can accept an input voltage rail between 3V and 14.5V and deliver an adjustable and highly accurate output voltage as low as 0.6V.

The LMZ31506 SIMPLE SWITCHER® power module is a step-down DC-DC solution capable of driving up to 6A load. The LMZ31506 module can accept an input voltage rail between 3V and 14.5V and deliver an adjustable and highly accurate output voltage as low as 0.6V. In older documentation this regulator was known as the TI TPS84621.

The LMZ31710 SIMPLE SWITCHER® power module is a step-down DC-DC solution capable of driving up to 10A load. The LMZ31710 module can accept an input voltage rail between 4.5V and 17V and deliver an adjustable and highly accurate output voltage as low as 0.6V.

These modules only requires two external resistors plus external capacitors to provide a complete power solution. These modules offer the following protection features: thermal shutdown, programmable input under-voltage lockout, output over-voltage protection, short-circuits protection, output current limit, and each allows startup into a pre-biased output.

The LMZ31710 sync input allows synchronization over the 200 kHz to 1,200 kHz switching frequency range and up to six modules can be connected in parallel for higher load currents.

Table 1-34 shows the ZC706 board TI power system configuration for controller U48.

Table 1-34: ZC706 TI Controller U48 Power System Configuration

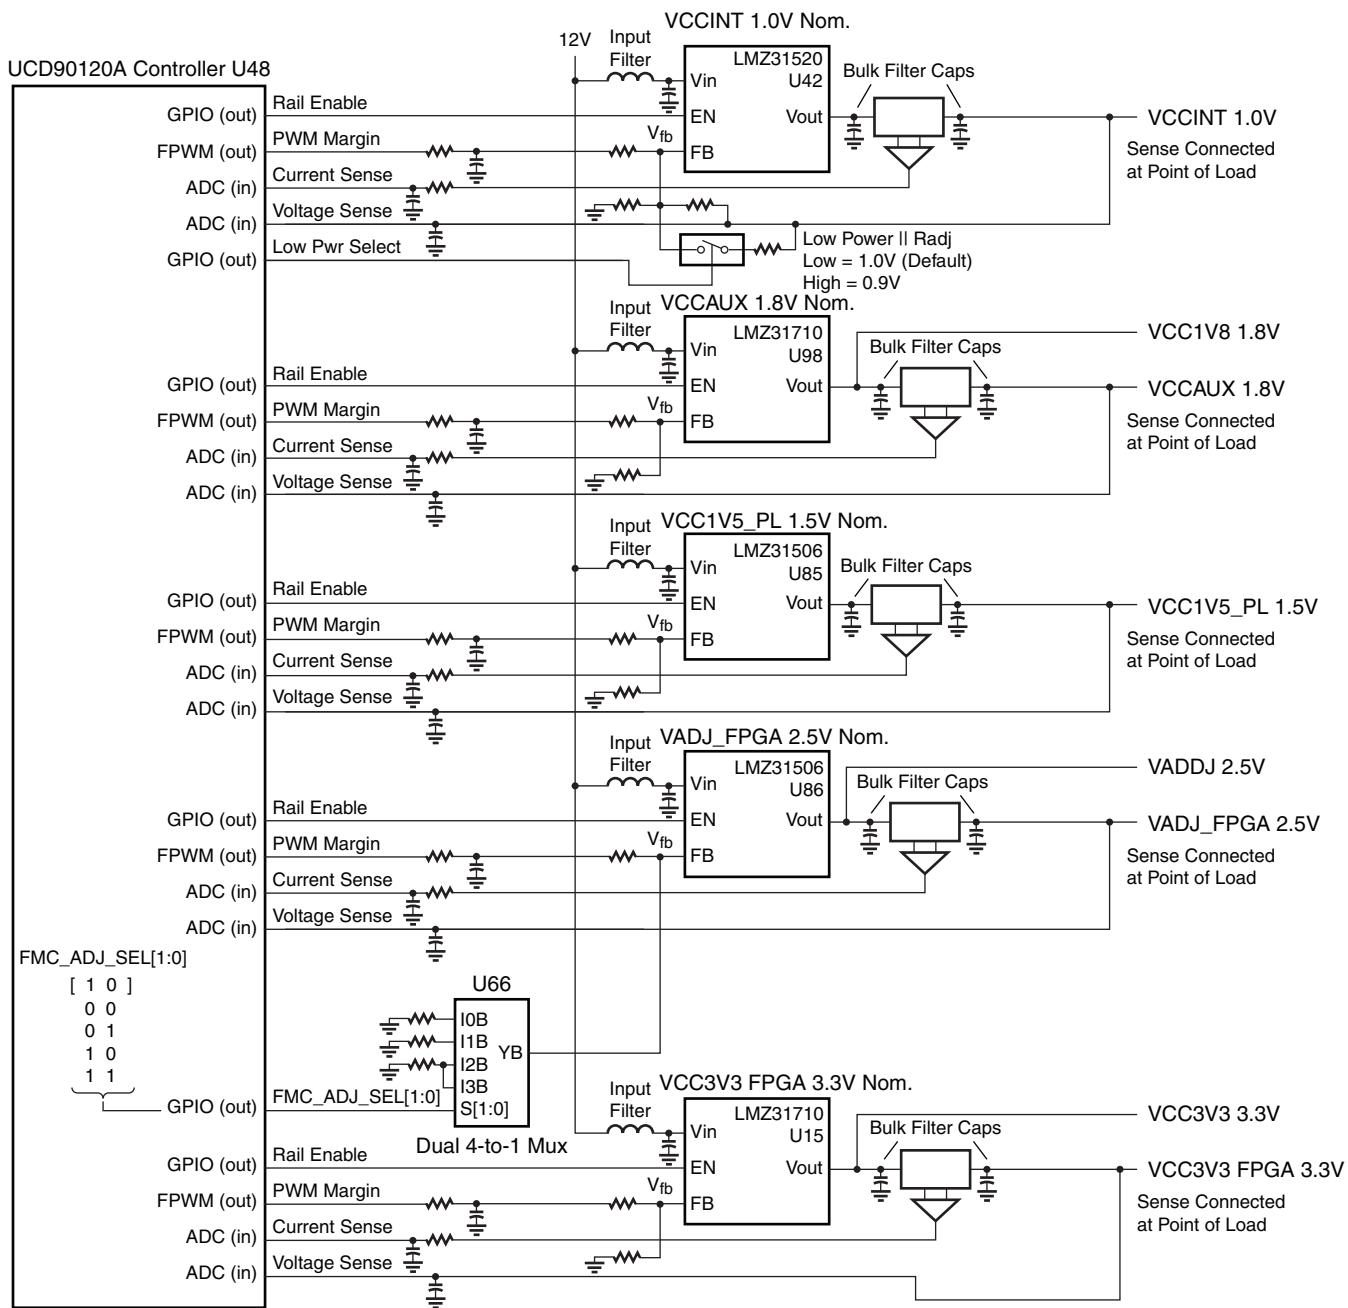

Sequencer	Schematic Page			Regulator Type, U#	Voltage	Current
	Page	Contents	Net Name

	54	Addr 101, Rail 5	VCC3V3_FPGA,VCC3V3	LMZ31710 U15 ⁽⁴⁾	3.3V	10A

Notes:

ZC706 boards prior to Rev. 2.0 implemented different voltage regulators for VCCINT, VCCAUX/VCC1V8, VCC1V5_PL, VADJ_FPGA/VADJ and VCC3V3_FPGA/VCC3V3. Refer to UG954 v1.3 and earlier, and to the schematic for the particular version of the ZC706 board prior to Rev. 2.0. Notes on ZC706 boards prior to Rev. 2.0:

1. VCCINT is implemented utilizing 2xLMZ22008 8A components (U42, U43) in parallel which provides 16A capability.
2. The 1.8V rails are supplied from a LMZ22010 10A component (U98).
3. VCC1V5_PL and the 2.5V rails are supplied from TPS84621 6A components (U85, U86).
4. The 3.3V rails are supplied from a LMZ22010 10A component (U15).

Figure 1-34 shows the power system for UCD90120A U48 controller.

UG954_c1_33_041615

Figure 1-34: ZC706 TI UCD90120A Controller U48 Power System

The LMZ31520, LMZ31506, and LMZ31710 adjustable voltage regulators have their output voltage set through an external resistor. The regulator topology on the ZC706 board permits the TI UCD90120A module to monitor rail voltage and current. Voltage margining at +5% and -5% is also implemented.

Each voltage regulator's external V_{OUT} setting resistor is calculated and implemented as if the regulator is stand-alone. The TI UCD90120A module has two ADC inputs allocated per voltage rail, one input for the remote voltage sense connection, the other for the current sense resistor op amp output voltage connection. The TI UCD90120A ADC full scale input is 2.5V. The remote voltage feedback is scaled to approximately 2V if it exceeds 2V, that is, the V_{CCO_VADJ} rail for the 2.5V and 3.3V modes, and the $FPGA_3V3$ rail also at 3.3V are resistor-attenuated to scale the remotely sensed voltage at a ratio of 0.606 to give approximately 2V at the ADC input pin for a 3.3V remote sense value. Rails below 2V are not scaled.

Each rail's current sense op amp has its gain set to provide approximately 2V maximum at the TI UCD90120A ADC input pin when the rail current is at its expected maximum current level, as can be seen in the U48 controller power system figure ([Figure 1-34](#)).

The TI UCD90120A module has an assignable group of GPIO pins with PWM capability. Each controller "channel" has a PWM GPIO pin wired to the associated voltage regulator V_{ADJ} pin. The external V_{OUT} setting resistor is also wired to this pin. The PWM GPIO pin is configured in 3-state mode. This pin is not driven unless a Margin command is executed. The Margin command is available within the TI Fusion Digital Power™ designer software.

During the margin-High or Low operation, the PWM GPIO pin drives a voltage into the voltage regulator V_{ADJ} pin, which causes a slight voltage change resulting in the regulator V_{OUT} moving to the margin +5% or -5% voltage commanded.

XADC Power System Measurement

The ZC706 board XADC interface includes power system voltage and current measuring capability. The V_{CCINT} and V_{CCAUX} rail voltages are measured using the XADC internal voltage measurement capability. Other rails are measured through an external Analog Devices ADG707BRU multiplexer U6. Each rail has a separate TI INA333 op amp strapped across its series current sense resistor Kelvin terminals. This op amp has its gain adjusted to give approximately 1V at the expected full scale current value for the rail.

Figure 1-35 shows the XADC external MUX block diagram.

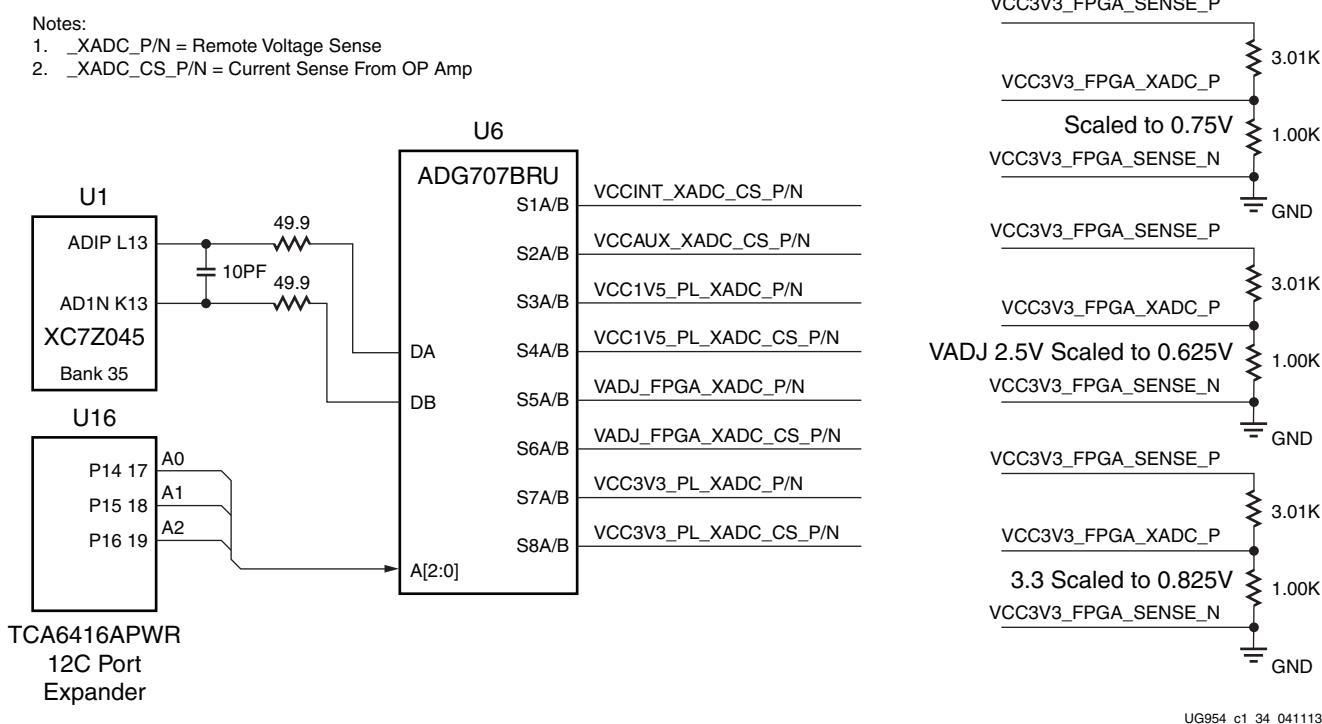

Figure 1-35: XADC External MUX Block Diagram

See Table 1-35 which lists the ZC706 XADC power system voltage and current measurement details for the external MUX U6.

Power Management

[Figure 1-3, callout 32]

The ZC706 board uses power regulators and a PMBus-compliant system controller from Texas Instruments to supply core and auxiliary voltages. The Texas Instruments Fusion Digital Power graphical user interface is used to monitor the voltage and current levels of the board power modules.

The PCB layout and power system design meet the recommended criteria described in *Zynq-7000 SoC PCB Design and Pin Planning Guide* ([UG933](#)).

The ZC706 evaluation board power distribution diagram is shown in [Figure 1-36](#).

UG954_c1_35_031615

Figure 1-36: Onboard Power Regulators

The ZC706 evaluation board uses power regulators and PMBus compliant PWM system controllers from Texas Instruments to supply the core and auxiliary voltages listed in [Table 1-36](#).

Table 1-36: Onboard Power System Devices

VADJ Voltage Control

The V_{ADJ} rail is set to 2.5V. When the ZC706 evaluation board is powered on, the state of the `FMC_VADJ_ON_B` signal wired to header J18 is sampled by the TI UCD90120A controller U48. If a jumper is installed on J18 signal `FMC_VADJ_ON_B` is held Low, and the TI controller U48 energizes the V_{ADJ} rail at power on.

Because the rail turn on decision is made at power on time based on the presence of the J18 jumper, removing the jumper at J18 after the board is powered up does not affect the 2.5V power delivered to the V_{ADJ} rail and it remains on.

A jumper installed at J18 is the default setting.

In this mode the user can control when to turn on V_{ADJ} and to which voltage level (1.8V, 2.5V, 3.3V). With V_{ADJ} off the XC7Z045 SoC still configures and has access to the TI controller PMBUS along with the FMC_VADJ_ON_B signal. The combination of these allows the user to develop code to command the V_{ADJ} rail to be set to something other than the default setting of 2.5V. Once the new V_{ADJ} voltage level has been programmed into TI controller U48, the FMC_VADJ_ON_B signal can be driven low by the user logic and the V_{ADJ} rail comes up at the new V_{ADJ} voltage level. Installing a jumper at J18 after a ZC706 board powers up in the V_{ADJ} off (no jumper on J18 at ZC706 power up) mode turns on the V_{ADJ} rail.

The FMC_VADJ_ON_B signal is connected to the TCA6416APWR I²C port expander U16 pin 13 (see [Figure 1-29](#)). The XC7Z045 SoC is thus able to drive the FMC_VADJ_ON_B signal by writing to the I²C port expander U16.

The I²C port expander IIC_PORT_EXPANDER SDA/SCL bus is wired to the PCA9548ARGER I²C U65 bus switch (see [I²C Bus, page 55](#)).

Documentation describing PMBUS programming for the UCD90120A power controller is available at the website [\[Ref 27\]](#).

SoC Programmable Logic (PL) Voltage Control

All PL and PS power rails are enabled by default. When the ZC706 board is powered on, the state of the PL_PWR_ON signal wired to 2-pin header J66 is sampled by the TI UCD90120A controller U48. If a jumper is not installed on J66, signal PL_PWR_ON is held high, and the TI controller U48 energizes all the PL and PS power rails.

Because the rail turn on decision is made at power on time based on the presence of the J66 jumper, installing the jumper at J66 after the board is powered up does not affect power delivered to the any PS or PL rails, all rails remain on.

A jumper not installed at J66 is the default setting.

If a jumper is installed on J66 when the ZC706 board is powered on, signal PL_PWR_ON is held low, and the ZC706 board does not energize the PL side power rails at power on.

Monitoring Voltage and Current

Voltage and current monitoring and control are available for selected power rails through Texas Instruments' Fusion Digital Power Designer graphical user interface. The onboard TI power controller (U48 at address 101) is accessed through the PMBus connector J4, which is provided for use with the TI USB Interface Adapter PMBus pod (TI part number EVM_USB-TO-GPIO), which can be ordered from the Texas Instruments website [\[Ref 28\]](#) and

associated TI Fusion Digital Power Designer GUI (downloadable from the TI site [\[Ref 29\]](#)). This is the simplest and most convenient way to monitor the voltage and current values for the power rails listed in [Table 1-37](#).

In the table, the Power Good (PG) On Threshold is the setpoint at or above which the particular rail is deemed "good". The PG Off Threshold is the setpoint at or below which the particular rail is no longer deemed "good". The controller internally OR's these per rail PG conditions together and drives an output PG pin high only if all active rail PG states are "good". The On and Off Delay and parameters are relative to when the board power on-off slide switch SW12 is turned on and off.

[Table 1-37](#) Power Rail Specifications for UCD90120A PMBus controller at Address 101 defines the voltage and current values for each power rail controlled by the UCD90120A U48.

IMPORTANT: In [Table 1-37](#), the values defined in the Shutdown columns are the voltage and current thresholds that cause the regulator to shut down if the value is exceeded.

Table 1-37: Power Rail Specifications for UCD90120A PMBus Controller at Address 101

Device	Address	Rail	Nominal Voltage	Power Good On	Power Good Off	Turn On Delay (ms) ⁽²⁾	Turn Off Delay (ms)	Shutdown ⁽¹⁾		
								Over Voltage	Over Current	
UCD90120A U48	101d	1	VCCINT	1.000	0.900	0.850	0.0	25.0	1.150	11.50
		2	VCCAUX	1.800	1.620	1.530	5.0	20.0	2.070	6.91
		3	VCC1V5_PL	1.500	1.350	1.275	5.0	10.0	1.725	3.50
		4	VADJ_FPGA	2.500	2.250	2.125	5.0	5.0	2.875	3.50
		5	VCC3V3_FPGA	3.300	2.970	2.805	5.0	15.0	3.795	6.91

Notes:

1. The values defined in these columns are the voltage and current thresholds that cause the regulator to shut down if the value is exceeded.
2. See [Table 1-39](#) for rail turn on dependency details.

The ZC706 power system rail turn on timing is not strictly controlled through the Turn On Delay shown in [Table 1-37](#). The [Table 1-37](#) Turn On Delay values are applied after the preceding rail has reached 90% of its nominal voltage. See [Table 1-38](#) for rail turn on dependency details.

Table 1-38: Power Rail Sequence On Dependencies for UCD90120A PMBus Controller at Address 101

Device	Address	Rail	Nominal Voltage	Turn On Order	Turn On Timing
UCD90120A	101d	1 VCCINT	1.000	1	Turn on at board power-on
		2 VCCAUX	1.800	2	5ms after VCCINT hits 90%
		5 VCC3V3_FPGA	3.300	3	5ms after VCCAUX hits 90%
		3 VCC1V5_PL	1.500	4	5ms after VCC3V3 hits 90%
		4 VADJ_FPGA	2.500	5	5ms after VCC1V5_PL hits 90%

Cooling Fan

The XC7Z045 SoC cooling fan connector is shown in [Figure 1-37](#).

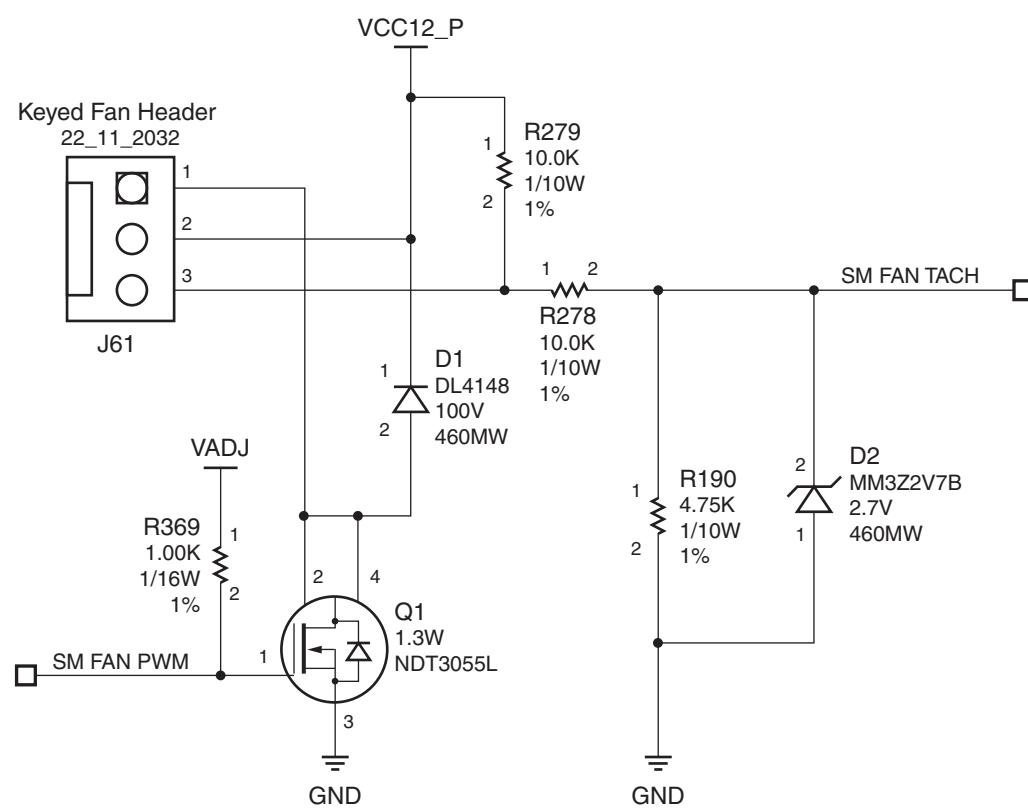

Figure 1-37: Cooling Fan Circuit

When V_{ADJ} is modified from a default of 2.5V to 1.8V or a lower V_{ADJ} setting, the SoC U1 cooling fan turns off. Transistor Q1 is used to switch on the fan and has a max VGS of 2V, hence the fan is not guaranteed to work at 1.8V or lower V_{ADJ} setting. See [\[Ref 16\]](#).

The fan turns on when the ZC706 is powered up due to pull-up resistor R369. The SM_FAN_PWM and SM_FAN_TACH signals are wired to XC7Z045 SoC U1 pins AB19 and

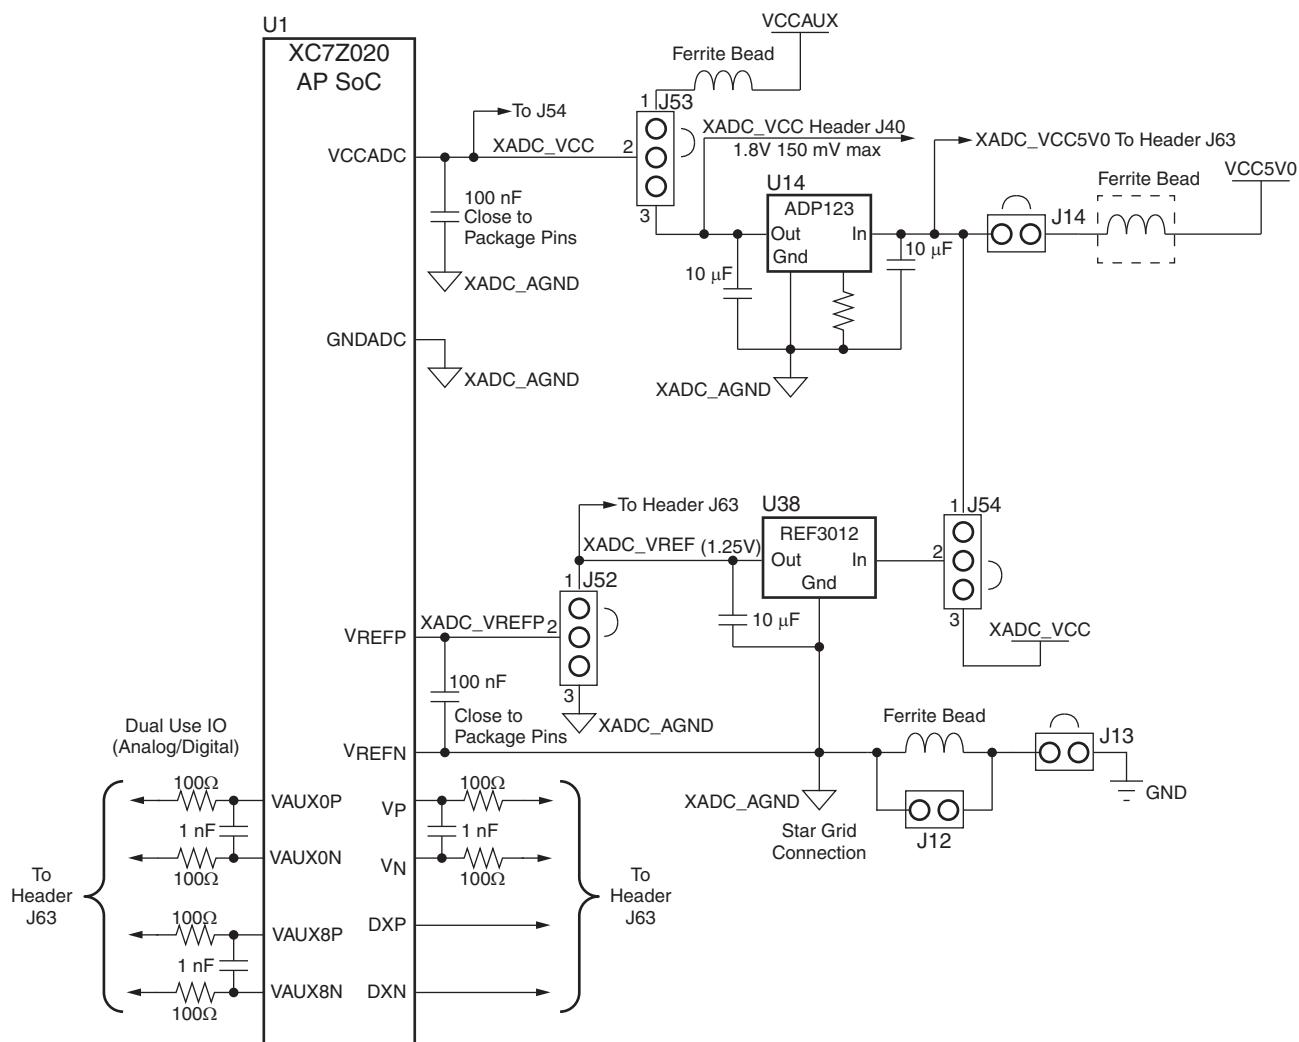

AA19 respectively, enabling the user to implement their own fan speed control IP in the SoC PL logic.

More information about the power system components used by the ZC706 evaluation board are available from the Texas Instruments digital power website [\[Ref 33\]](#).

XADC Analog-to-Digital Converter

[\[Figure 1-3, callout 33\]](#)

The XC7Z045 SoC provides an Analog Front End XADC block. The XADC block includes a dual 12-bit, 1 MSPS Analog-to-Digital Convertor (ADC) and on-chip sensors. See *7 Series FPGAs and Zynq-7000 SoC XADC Dual 12-Bit 1 MSPS Analog-to-Digital Converter User Guide (UG480)* for details on the capabilities of the analog front end. [Figure 1-38](#) shows the XADC block diagram.

UG8954_c1_37_041715

Figure 1-38: XADC Block Diagram

The ZC706 evaluation board supports both the internal XC7Z045 SoC sensor measurements and the external measurement capabilities of the XADC. Internal measurements of the die temperature, VCCINT, VCCAUX, and VCCBRAM are available.

Jumper J52 can be used to select either an external voltage reference (VREF) or on-chip voltage reference for the analog-to-digital converter.

For external measurements an XADC header (J63) is provided. This header can be used to provide analog inputs to the XC7Z045 SoC's dedicated VP/VN channel, and to the VAUXP[0]/VAUXN[0], VAUXP[8]/VAUXN[8] auxiliary analog input channels. Simultaneous sampling of Channel 0 and Channel 8 is supported.

A user-provided analog signal multiplexer card can be used to sample additional external analog inputs using the 4 GPIO pins available on the XADC header as multiplexer address lines. [Figure 1-39](#) shows the XADC header connections.

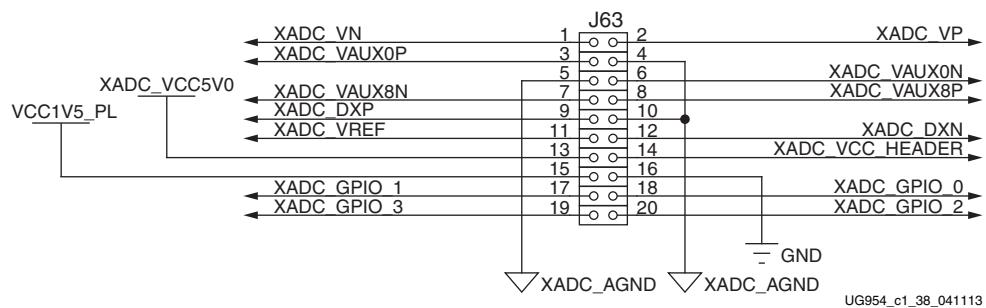

Figure 1-39: XADC Header (J63)

[Table 1-39](#) describes the XADC header J40 pin functions.

Table 1-39: XADC Header J63 Pinout

Net Name	J63 Pin Number	Description
VN, VP	1, 2	Dedicated analog input channel for the XADC.
XADC_VAUX0P, N	3, 6	Auxiliary analog input channel 0. Also supports use as I/O inputs when anti alias capacitor is not present.
XADC_VAUX8N, P	7, 8	Auxiliary analog input channel 8. Also supports use as I/O inputs when anti alias capacitor is not present.
DXP, DXN	9, 12	Access to thermal diode.
XADC_AGND	4, 5, 10	Analog ground reference.
XADC_VREF	11	1.25V reference from the board.
XADC_VCC5V0	13	Filtered 5V supply from board.
XADC_VCC_HEADER	14	Analog 1.8V supply for XADC.
VCC1V5_PL	15	VCCO supply for bank which is the source of DIO pins.

Table 1-39: XADC Header J63 Pinout (Cont'd)

Net Name	J63 Pin Number	Description
GND	16	Digital Ground (board) Reference
XADC_GPIO_3, 2, 1, 0	19, 20, 17, 18	Digital I/O. These pins should come from the same bank. These IOs should not be shared with other functions because they are required to support three-state operation.

Default Switch and Jumper Settings

The default switch and jumper settings for the ZC706 evaluation board are provided in this appendix.

Switches

[Figure 1-3, callout 24]

Default switch settings are listed in [Table A-1](#). The locations of the ZC706 jumper headers called out in [Table A-2](#) are shown in [Figure A-1](#).

Table A-1: Default Switch Settings

Switch	Function	Default	Selects	Figure 1-3 Callout
SW1	Board main power On-Off Slide Switch	OFF	Delivered in OFF position	27
SW4	2-pole SPST DIP Switch, JTAG mode select signals JTAG_SEL_[1:2]	10	JTAG = cable connector J3	34
SW11	5-pole DPDT DIP Switch, PS Boot Mode select signals MIO[6:2]_SELECT	All Down	JTAG flat cable header J3	29
SW12	4-pole SPST DIP Switch, user signals GPIO_DIP_SW[0:3], poles [1:4]	All OFF	All = 0 (4.7K p/d to GND)	24

Jumpers

[Figure 1-3, callout 24]

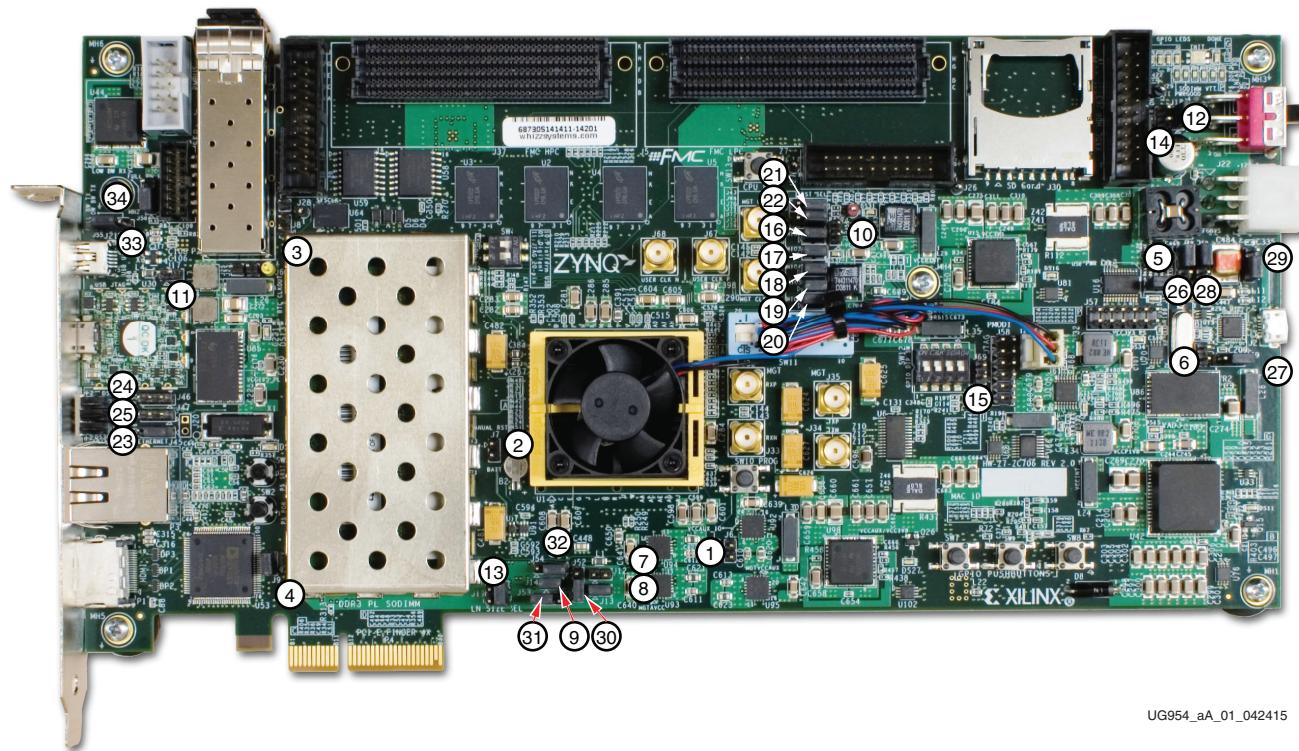

Default jumper positions are listed in [Table A-2](#).

Table A-2: Default Jumper Settings

Jumper Callout	Jumper	Function	Default Jumper Position	Option Selected	Schematic 0381513 Page

Figure B-2: FMC HPC Connector Pinout

Xilinx Constraints File

The Xilinx Design Constraints (XDC) template for the ZC706 board provides for designs targeting the ZC706 evaluation board. Net names in the constraints correlate with net names on the latest ZC706 evaluation board schematic. Users must identify the appropriate pins and replace the net names with net names in the user RTL. See *Vivado Design Suite User Guide: Using Constraints* ([UG903](#)) for more information.

The FMC connectors J37 and J5 are connected to 2.5V V_{ADJ} banks. Because different FMC cards implement different circuitry, the FMC bank I/O standards must be uniquely defined by each customer.

Note: Refer to the Board Files area of the documentation tab on the Xilinx Zynq-7000 SoC ZC706 Evaluation Kit product page (www.xilinx.com/zc706) for the latest xdc constraints file.

Refer to the Zynq-7000 SoC ZC706 Evaluation Kit - Known Issues and Release Notes Master Answer Record concerning the CE requirements for the PC Test Environment:

[Zynq-7000 SoC ZC706 Master Answer Record 51899](#)

Board Setup

Installing the ZC706 Board in a PC Chassis

Installation of the ZC706 board inside a computer chassis is required when developing or testing PCI Express® functionality.

When the ZC706 board is used inside a computer chassis (that is, plugged in to the PCIe® slot), power is provided from the ATX power supply 4-pin peripheral connector through the ATX adapter cable shown in [Figure D-1](#) to J22 on the ZC706 board. The Xilinx part number for this cable is 2600304, and is equivalent to Sourcegate Technologies part number AZCBL-WH-1109-RA4. For information on ordering this cable, see [\[Ref 37\]](#).

Figure D-1: ATX Power Supply Adapter Cable

To install the ZC706 board in a PC chassis:

1. On the ZC706 board, remove all six rubber feet and standoffs and the PCIe bracket. The standoffs and feet are affixed to the board by screws on the top side of the board. Remove all six screws.
2. Re-attach the PCIe bracket to the ZC706 board using two of the previously removed screws.
3. Power down the host computer and remove the power cord from the PC.
4. Open the PC chassis following the instructions provided with the PC.
5. Select a vacant PCIe expansion slot and remove the expansion cover (at the back of the chassis) by removing the screws on the top and bottom of the cover.
6. Plug the ZC706 board into the PCIe connector at this slot and secure its PCIe bracket to the chassis with a screw at the top of the bracket.

7. The ZC706 board is taller than standard PCIe cards. Ensure that the height of the card is free of obstructions.
8. Connect the ATX power supply to the ZC706 board using the ATX power supply adapter cable as shown in [Figure D-1](#):
 - a. Plug the 6-pin 2 x 3 Molex connector on the adapter cable into J22 on the ZC706 board.
 - b. Plug the 4-pin 1 x 4 peripheral power connector from the ATX power supply into the 4-pin adapter cable connector.
9. Slide the ZC706 board power switch SW1 to the ON position. The PC can now be powered on.

Board Specifications

Dimensions

Height 5.5 inch (14.0 cm)

Length 10.5 inch (26.7 cm)

Note: The ZC706 board height exceeds the standard 4.376 inch (11.15 cm) height of a PCI Express card.

Environmental

Temperature

Operating: 0°C to +45°C

Storage: -25°C to +60°C

Humidity

10% to 90% non-condensing

Operating Voltage

+12 V_{DC}

Regulatory and Compliance Information

Overview

This product is designed and tested to conform to the European Union directives and standards described in this section.

Refer to the Zynq-7000 SoC ZC706 Evaluation Kit - Known Issues and Release Notes Master Answer Record concerning the CE requirements for the PC Test Environment:

[Zynq-7000 SoC ZC706 Master Answer Record 51899](#)

Declaration of Conformity

The Zynq-7000 SoC ZC706 Evaluation Kit CE [Declaration of Conformity](#) is online.

CE Directives

2006/95/EC, *Low Voltage Directive (LVD)*

2004/108/EC, *Electromagnetic Compatibility (EMC) Directive*

CE Standards

EN standards are maintained by the European Committee for Electrotechnical Standardization (CENELEC). IEC standards are maintained by the International Electrotechnical Commission (IEC).

Electromagnetic Compatibility

EN 55022:2010, *Information Technology Equipment Radio Disturbance Characteristics – Limits and Methods of Measurement*

EN 55024:2010, *Information Technology Equipment Immunity Characteristics – Limits and Methods of Measurement*

This is a Class A product. In a domestic environment, this product can cause radio interference, in which case the user might be required to take adequate measures.

Safety

IEC 60950-1:2005, *Information technology equipment – Safety, Part 1: General requirements*

EN 60950-1:2006, *Information technology equipment – Safety, Part 1: General requirements*

Markings

In August of 2005, the European Union (EU) implemented the EU WEEE Directive 2002/96/EC and later the WEEE Recast Directive 2012/19/EU requiring Producers of electronic and electrical equipment (EEE) to manage and finance the collection, reuse, recycling and to appropriately treat WEEE that the Producer places on the EU market after August 13, 2005. The goal of this directive is to minimize the volume of electrical and electronic waste disposal and to encourage re-use and recycling at the end of life.

Xilinx has met its national obligations to the EU WEEE Directive by registering in those countries to which Xilinx is an importer. Xilinx has also elected to join WEEE Compliance Schemes in some countries to help manage customer returns at end-of-life.

If you have purchased Xilinx-branded electrical or electronic products in the EU and are intending to discard these products at the end of their useful life, please do not dispose of them with your other household or municipal waste. Xilinx has labeled its branded electronic products with the WEEE Symbol to alert our customers that products bearing this label should not be disposed of in a landfill or with municipal or household waste in the EU.

This product complies with Directive 2002/95/EC on the restriction of hazardous substances (RoHS) in electrical and electronic equipment.

In August of 2005, the European Union (EU) implemented the EU WEEE Directive 2002/96/EC and later the WEEE Recast Directive 2012/19/EU requiring Producers of electronic and electrical equipment (EEE) to manage and finance the collection, reuse, recycling and to appropriately treat WEEE that the Producer places on the EU market after August 13, 2005. The goal of this directive is to minimize the volume of electrical and electronic waste disposal and to encourage re-use and recycling at the end of life.

Xilinx has met its national obligations to the EU WEEE Directive by registering in those countries to which Xilinx is an importer. Xilinx has also elected to join WEEE Compliance Schemes in some countries to help manage customer returns at end-of-life.

If you have purchased Xilinx-branded electrical or electronic products in the EU and are intending to discard these products at the end of their useful life, please do not dispose of them with your other household or municipal waste. Xilinx has labeled its branded electronic products with the WEEE Symbol to alert our customers that products bearing this label should not be disposed of in a landfill or with municipal or household waste in the EU.

This product complies with CE Directives 2006/95/EC, *Low Voltage Directive (LVD)* and 2004/108/EC, *Electromagnetic Compatibility (EMC) Directive*.
